

	<p><i>Discovery of the Secrets of Life Timeline:</i> <i>A Chronological Selection of Historic Events, Discoveries and Publications from Diverse Subjects Pertaining to the Development of Molecular Biology.</i> Though the references are presented chronologically, the history did not necessarily follow a precisely linear track, since scientists in the different disciplines comprising this story may not have been immediately aware of all developments, or may not have understood developments outside their specialized fields. Copyright 2002 Jeremy M. Norman</p>		
<i>Date</i>	<i>Event, Discovery or Publication</i>	<i>References</i>	<i>In Archive</i>
1840	Crystals of plant and animal products do not typically occur naturally. F. L. Hünefeld accidentally observes the first protein crystals— those of hemoglobin—in a sample of dried menstrual blood pressed between glass plates. Hunefeld, <i>Der Chemismus in der thierischen Organisation</i> , Leipzig: Brockhaus, 1840, 158-63.	Lesk, Protein Structure, 36; Tanford & Reynolds, Nature's Robots, 22.; Judson, 489	
1847	In his dissertation Louis Pasteur begins a series of “investigations into the relation between optical activity, crystalline structure, and chemical composition in organic compounds, particularly tartaric and paratartaric acids. This work focused attention on the relationship between optical activity and life, and provided much inspiration and several of the most important techniques for an entirely new approach to the study of chemical structure and composition. In essence, Pasteur opened the way to a consideration of the disposition of atoms in space.” (DSB) Pasteur, <i>Thèses de Physique et de Chimie, Présentées à la Faculté des Sciences de Paris</i> . Paris: Bachelier, 1847.	HFN 1652; Lesk 36	
1853	Otto Funcke (1828-1879) publishes illustrations of crystalline hemoglobin of horse, humans and other species in his <i>Atlas der physiologischen Chemie</i> , Leipzig: W. Englemann, 1853.	G-M 684	
1858	Charles Darwin and Alfred Russel Wallace publish the first exposition of the theory of natural selection. Darwin and Wallace, “On the Tendency of Species to Form Varieties, and on the Perpetuation of Varieties and Species by Natural Means of Selection,” <i>J. Proc. Linn. Soc.</i> 3 (1858) Zool. 45-62.	G-M 219	
1859	Darwin publishes <i>On the Origin of Species by Means of Natural Selection</i> , London: John Murray, 1859.	G-M 220	
1864	Felix Hoppe-Seyler names the protein crystallized from blood	Judson 490	

	haematoglobulin or haemoglobin. Hoppe-Seyler, “Ueber die chemischen und optischen Eigenschaftern des Blutsfarbstoffs,” <i>Arch. F. path. Anat. U. Physiol.</i> (Virchow’s Archiv) 29 (1864) 233-35.		
1865	Working with clearly identifiable traits in the pea plant, (seed color and shape, stem length, position of the flowers) Gregor Mendel discovers a generalized set of rules concerning heredity. He postulates that there are discrete units of heredity (what we call genes) that are transmitted from generation to generation even though some of these are not expressed as an observable trait in every generation. He discovers <i>dominant</i> and <i>recessive</i> traits— what we call segregation and what we call <i>alleles</i> . Mendel, “Versüchē über Pflanzen-Hybriden,” <i>Verh. Naturf. Vereins Brünn</i> 4 (1866) 3-47. Published in a relatively obscure journal, and dramatically advanced for their time, Mendel’s discoveries will ignored by the scientific community until they are rediscovered by de Vries, Correns, and Tschermach in 1900.	Brock ch. 2.1; G-M 222	
1870	W. Flemming Discovery of mitosis	Brock ch. 3.9	
1871	Discovery of nucleoprotein, later shown to be the hereditary genetic material: Johann Friedrich Miescher, “Ueber die chemische Zusammensetzung der Eiterzellen,” in F. Hoppe-Seyler, <i>Medicinish-chemische Untersuchungen</i> , Heft 4 (Berlin, 1871), pp. 441-60.	G-M 695	
1871	Wilhelm Preyer (1841-97), best known as a psychologist, describes crystals from nearly 50 species of animals in <i>Die Blutkrystalle</i> , Leipzig: Mauke, 1871. Most of these are artificially induced from blood “by adding water to lyse the red blood cells and to solubilize their contents, followed by slight acidification with carbon dioxide.”	Tanford & Reynolds 22	
1875	Charles Darwin publishes his ideas for a mechanism of inheritance in the 1875 edition of <i>The Variation of Plants and Animals under Domestication</i> [check edition?]. “Darwin advanced a provisional hypothesis that he called pangenesis. He postulated the existence in tissues of minute granules capable of multiplication by self-division; these granules were present in parts of the organism and were collected together to constitute the sexual elements involved in the development of the new generation. He called these granules <i>gemmules</i> .” (Brock p. 8) Darwin’s ideas influence de Vries’ hypothesis of <i>intracellular pangenesis</i> that ultimately leads to the concept of the gene.	Brock ch. 2.2	

1880	Louis Pasteur develops methods for reducing the virulence of a bacterial pathogen. These genetic methods he calls <i>attenuation</i> lead to his vaccination for anthrax and rabies. Pasteur, “De l’attenuation du virus du cholera des poules”. <i>Comptes rendus</i> 91 (1880) 673-680.	Brock ch. 3.5	
1881	Robert Koch develops the agar plate technique for isolating pure cultures of bacteria. Using this method in 1882, he isolates the causal agents of tuberculosis, <i>Mycobacterium tuberculosis</i> , and cholera, <i>Vibrio cholerae</i> .	Brock ch. 3.3	
1883	Wilhelm Roux, in <i>Über die Bedeutung der Kerntheilungsfiguren</i> , Leipzig: Engelmann, 1883, argues that mitosis insures a precise halving of the nucleus, suggesting that the nucleus contains the material basis of heredity.	G-M 229	
1884	Eduard Strasburger publishes <i>Neue Untersuchungen über den Befruchtungsvorgang bei den Phanerogamen als Grundlage für eine Theorie der Zeugung</i> , Jena: Fischer, 1884, using microscopical evidence to support the hypothesis that the cell nucleus contains the material basis of heredity	G-M 229.1	book
1886-97	Study of the chemistry of the cell and cell nucleus: Albrecht Kossel, “Zur Chemie des Zellkerns,” <i>Hoppe-Seyl Z. physiol. Chem.</i> 7 (1882-83): 7-22; 10 (1886): 248-64; 22 (1896-97): 176-87	G-M 702	Offprint; Miescher’s copy
1888	Theodor Boveri gives decisive proof of the maintenance of chromosomal individuality in “Zellen-Studien,” <i>Jena Z. Naturw.</i> , 1888, 22 -685-882.	G-M 231.1	
1889	Hugo de Vries develops his hypothesis of intracellular pangenesis, in which he postulates living, self-replicating units that he calls <i>pangenes</i> . “de Vries’ pangene subsequently provided the model for the modern gene.” (Brock p. 9) de Vries, <i>Intracellulare Pangenesis</i> . Jena: Fischer, 1889.	Brock ch. 2.3	
1889	Francis Galton presents the first statistical study of biological variation and inheritance in his book, <i>Natural Inheritance</i> . (London: Macmillan, 1889)	G-M 233	
1889	Richard Altmann, “Ueber Nucleinsäuren,” <i>Arch. Anat. Physiol. Abt.</i> (1889): 524-36	G-M 713	
1893-94	Albrecht Kossel, “Ueber die Nucleinsäure,” <i>Arch. Anat. Physiol., Physiol. Abt.</i> (1893): 157-64; (1894): 194-203	G-M 719	Offprint; Miescher’s copy
1894	Emil Fischer provides “provides a structural interpretation of the		

	selectivity of enzymes—their ability to discriminate among very similar molecules, as Pasteur had observed in the fermentation of tartaric acid.” (Les p. 36) Fischer writes, “Only with a similar geometrical structure can molecules approach each other closely, and thus initiate a chemical reaction. To use a picture, I should say that the enzyme and substrate must fit each other like a lock and key.” (Quoted by Lesk) [Reference needed, etc.]		
1895	Wilhelm Konrad Röntgen discovers X-rays.	HFN, etc.	
1898	Prediction of the polypeptide nature of the protein molecule. In a series of papers through 1912 Kossel proposes “that amino acids and their spatial arrangement with the protein must become the chemical key to understanding of proteins” (Tanford & Reynolds, 52). Albrecht Kossel, “Ueber die Eiweissstoffe,” <i>Dtsch. med. Wschr.</i> 24 (1898): 581-82. See also paper of 1900 and Herter Lecture in English 1912.	G-M 721; Tanford & Reynolds, Nature’s Robots, 52	Offprint; Miescher’s copy
1900	Rediscovery and confirmation of Mendel’s laws almost simultaneously by de Vries, Correns, and Czermach: Hugo de Vries, “Das Spaltungsgesetz der Bastarde,” <i>Ber. dtsh. botanisch. Ges.</i> 18 (1900): 83-90.	Brock ch. 2.3; G-M 239.01	
1900	Rediscovery of Mendel’s laws: Carl F. J. E. Correns, “Mendel’s Regel über das Verhalten der Nachkommenschaft der Rassenbastarde,” <i>Ber. dtsh. botanisch. Ges.</i> 18 (1900): 158-67	G-M 239.1	
1900	Rediscovery of Mendel’s laws: Erich Tschermak von Seysenegg, “Über künstliche Kreuzung von <i>Pisum sativum</i> ,” <i>Z. landwirtsch. Versuchsw. in Österreich</i> 3 (1900): 465-555.; reprinted in <i>Ber. Dtsch. Botanisch. Ges.</i> 18 (1900) 232-239	G-M 239.2	
1900	Martinus Beijerinck applies de Vries’ mutation theory to bacteria.	Brock ch. 4.1	
1900	F. Dienert First adaptive enzyme	Brock ch. 10.1	
1901	E. Wildiers First growth factor in a microorganism	Brock ch. 3.8	
1903	Support for Mendelian law of inheritance: Wilhelm Johannsen, <i>Ueber Erblichkeit in Populationen und in reinen Linien</i> (Jena: Fischer, 1903).	G-M 242	Book
1903	Chemical distinction between DNA and RNA: Phoebus A. T. Levene, “Darstellung und Analyse einiger Nucleinsäuren,” <i>Hoppe-Seyl. Z. physiol. Chem.</i> 39 (1903): 4-8, 133-35, 479-83	G-M 725.1	

1903	Walter S. Sutton, in his “The Chromosomes in Heredity” (<i>Biol. Bull.</i> 4 [1903]: 231-51), advances the theory that Mendel’s factors are hereditary particles borne on the chromosomes, and that Mendel’s laws for his factors are the direct result of chromosome behavior in meiosis	G-M 242.1	
1904	A.F. Blakeslee Discovery of sexual differentiation in a microorganism	Brock ch. 5.1	
1906-23	In a series of papers, Emil Fischer shows that animal and vegetable proteins are composed of a series of amino acids united by elimination of water. Published as <i>Untersuchungen über Aminosäuren, Polypeptide und Proteine</i> (Berlin: J. Springer, 1906-23)	G-M 730	
1907	R. Massini Discovery of <i>Escherichia coli-mutabile</i> , first <i>lac-negative</i> mutant	Brock ch. 4.4	
1908	Archibald E. Garrod hypothesizes that each biochemical defect, or “inborn error in metabolism” that causes certain hereditary diseases may be caused by an interruption or block in a metabolic sequence due to the congenital lack of a particular enzyme. At this time Garrod’s hypothesis concerning a gene-enzyme link cannot be tested. Garrod, “The Croonian Lectures on Inborn Errors of Metabolism,” <i>Lancet</i> 4 (1908) 1-7. He publishes a book with the same title the following year.	Brock ch. 2.6; Hook & Norman 875	
1909	Wilhelm Johannsen coins the term “gene” as the “underlying structure in the organism, that which was transmitted during hybridization.” (Brock) in <i>Elemente der Exakten Erblichkeitslehre</i> . Jena: Fischer, 1909. He coins the term <i>phenotype</i> to express what is actually observed and can be measured in contrast to <i>genotype</i> that he coins “to express the underlying constitution of the organism from which development of the organism begins. This constitution we designate by the word genotype. The word is entirely independent of any hypothesis...” (quoted by Brock p.11).	Brock ch. 2.5	
1909	Edward Tyson Reichert and Amos Peaslee Brown publish <i>The Crystallography of Hemoglobin</i> and show by studying the crystalline hemoglobin of more than 500 species that these hemoglobins are not identical. “No comparable effort had ever been expended in investigating species differences at the molecular level.” (Tanford & Reynolds 23). [Exact reference needed.]	Judson, pp. 492-93, 682	Book from Perutz’s library
1910	Thomas Hunt Morgan demonstrates sex-linked inheritance in “Sex-Linked Inheritance in <i>Drosophila</i> ,” <i>Science</i> , 1910, 32 , 120-22.	G-M 245.2	Offprint

1911	Morgan, in “Random Segregation versus Coupling” (<i>Science</i> 34 [1911]: 384), proposes that Mendelian factors (genes) are arranged in a linear series on chromosomes and that the degree of linkage between two genes on the same chromosome depends on the distance between them. In 1933 Morgan will win the Nobel Prize (Medicine/Physiology) for his studies of the role of the chromosomes in heredity.	G-M 245.3; Brock ch. 2.7	Offprint (?)
1912	Von Laue, Friedrich, and Knipping discover the first diffraction pattern of X-rays in a crystal— of copper sulfate. W. Friedrich, P. Knipping and Max von Laue, “Interferenz-Erscheinungen bei Röntgenstrahlen,” <i>Sitzungsb. k. Bayer. Akad. Wiss., math.-phys. Klasse</i> (8 June 1912): 303-22.	PMM	
1912	Jacques Loeb publishes <i>The Mechanistic Conception of Life</i> (Chicago: U. Chicago Press, 1912), in which he expresses the “hope that ultimately life, i.e. the sum of all life phenomena, can be unequivocally explained in physico-chemical terms”	Judson, p. 186	Book
1912 November- 1913 January	Five months after Laue publishes his discovery, William Lawrence Bragg at the age of 22, discovers that the regular pattern of dots produced on a photographic plate by an X-ray beam passing through a crystal could be regarded as a reflection of electromagnetic radiation from planes in a crystal that were especially densely studded with atoms. From this work the younger Bragg derives the “Bragg relation” ($n\lambda = 2d \sin \theta$). This relates the wavelength of the X-ray to the angle at which such a reflection could occur. “The Diffraction of Short Electromagnetic Waves by a Crystal,” read 11 Nov. 1912 and published in <i>Proc. Cambridge Phil. Soc.</i> 17 (14 Feb. 1913): 43-57; W. H. Bragg, “X-rays and Crystals,” <i>Nature</i> 90 (23 Jan. 1913): 572;	HFN 311	Have photocopy in Perutz’s collection of Bragg’s complete offprints
1913 July	The Braggs construct the first X-ray spectrometer using crystals as gratings, using a known wavelength to determine the distances between atomic planes—and thus the structure—of crystalline substances. By the end of 1913 the Braggs reduce the problem of crystal structure analysis to a standard procedure. W. H. and W. L. Bragg, “The Reflection of X-rays by Crystals,” <i>Proc. Roy. Soc. London</i> 88A (1 July 1913): 428-30 and 889A (22 Sept. 1913): 246-48.	HFN 312	
1913	Nishikawa and Ono take X-ray diffraction photographs of silk—the first of a biological molecule. They conclude quantitatively “that the material		

	must contain some ordered structure at the molecular level” (Lesk p. 36)		
1913	Proof that the genes are arranged in a linear sequence along the chromosome: Alfred Henry Sturtevant, “The linear arrangement of six sex-linked factors in <i>Drosophila</i> , as shown by their mode of association,” <i>J. expl. Zool.</i> 14 (1913): 43-59	G-M 245.4	
1914 August 1-3	Germany declares war on Russia (August 1) and on France (August 3). World War I begins		
1915	Frederick W. Twort discovers a “glassy transformation”— a microbe that is transmissible, filterable, invisible under the light microscope, and does not multiply in the absence of living bacteria. He wonders whether this microbe is a virus or an enzyme or whether the virus itself is some kind of enzyme. Twort, “An Investigation on the Nature of the Ultramicroscopic Viruses,” <i>Lancet</i> 189 (1915) 1241-43.	Brock ch. 6.1; G-M	
1915	Thomas Hunt Morgan, with Alfred. J. Sturtevant, Hermann. J. Muller and Calvin. B. Bridges, publishes <i>The Mechanism of Mendelian Heredity</i> . This epoch-making book presents evidence that genes are arranged linearly on chromosomes and that Mendelian laws are demonstrated by observable events occurring in cells. “By 1915 Morgan and his co-workers were able to present the locations on a genetic map for 30 distinct genes of the four <i>Drosophila</i> chromosomes” (Brock pp. 14-15)	G-M 246	
1916	L.J. Cole and W.H. Wright promote the “pure line” concept in bacteriology. “Pure line is defined by Johannsen as ‘the descendants from one single homozygotic organism, exclusively propagating by self-fertilization;’ but for our purposes in the case of bacteria, in which reproduction is asexual, it may be taken as the descendants from any single cell. (The term clone is coming to be largely used by biologists to designate the aggregate line of descendants from a single individual when reproduction is vegetative or asexual. . .)” (Cole & Wright, quoted by Brock p. 49). Cole & Wright, “Application of the Pure-Line Concept to Bacteria,” <i>J. Infect. Dis.</i> 56 (1916) 209-21.	Brock ch. 4.2	
1917	Leonard T. Troland develops an enzyme theory of life, distinguishes between autocatalysis and heterocatalysis. His ideas are influential on Hermann Muller. Troland, “Biological Enigmas and the Theory of Enzyme Action,” <i>American Naturalist</i> 51 (1917) 321-50.	Brock pp.19-20	
1917	Felix d’Herelle, independently of Twort, discovers a microbe-eating virus	Brock ch. 6.1	

	that he calls “bacteriophage.” The is the origin of the modern usage “phage.” Incorrectly d’Herelle believes that bacteriophage play a role in immunity and are a potential therapeutic agent. These misconceptions stimulate research on phage. d’Herelle, “ Sur un Microbe Invisible Antagoniste des Bacilles Dysentériques,” <i>Comptes rendus</i> 165 (1917) 373-75.		
1918	Germany signs the armistice, ending World War I.		
1919	<p>Thomas Hunt Morgan publishes <i>The Physical Basis of Heredity</i>, Philadelphia: Lippincott, 1919. In this he first uses the word gene. Previously he had used the term “Mendelian unit” or “factor.” “On the basis of genetic analysis, Morgan could present a number of characteristics of genes.</p> <ol style="list-style-type: none"> 1. A gene could have more than one effect. For instance, insects that had the white-eye gene not only had white eyes, but also grew slower and had a lower viability. 2. The effects of the gene could be modified by external conditions, but these modifications were not transmitted to future generations. The gene itself was stable; only the character that the gene controlled varied. 3. Characters that were indistinguishable phenotypically could be the product of different genes. 4. 4At the same time, each character was the product of many genes. For instance, 50 different genes were known to affect eye color, 15 affected body color, and 10 affected length of wing. 5. Heredity was therefore not some property of the ‘organism as a whole,’ but rather of the genes. 6. Genes of the pair did not jump out of one chromosome into another, but changed when the chromosome thread broke as a piece in front of or else behind them. Thus, crossing-over affected linked genes a groups and was a product of the behavior of the chromosome as an entity. <p>Morgan’s studies were based, to a great extent, on the availability of a large number of mutants, but the nature of the mutation process itself</p>	Brock ch. 2.7	

	remained a mystery. . .”(Brock p. 15)		
1921	J.A. Arkwright Description of smooth / rough variation in bacteria	Brock ch. 4.5	
1921	Felix d’Herelle publishes an influential book, <i>Le Bactériophage. Son Role dans l’Immunité</i> , Paris: Masson, 1921. This describes the life-history of a bacterial virus. English translation, 1926.		English translation?
1921	<p>Speaking in December 1921, Hermann J. Muller states that bacteriophage may be a free-living gene. “...there is a phenomenon...of ...striking nature, which must not be neglected by geneticists. This is the d’Herelle phenomenon...if these d’Herelle bodes were really genes, fundamentally like our chromosome genes, the would give us an utterly new angle from which to attack the gene problem...we cannot categorically deny that perhaps we may be able to grind genes in a mortar and cook them in a beaker after all. Must we geneticists become bacteriologists, physiological chemists, physicists, simultaneously with being zoologists and botanists? Let us hope so” (Muller)</p> <p>Brock p. 16: “According to Carlson (1981), when Muller completed his lecture that included the mention of phage as a possible gene analog, his colleagues thought they had been treated to a fanciful hoax.”</p> <p>“It is commonly said that evolution rests upon two foundations—inheritance and variation; but there is a subtle and important error here. Inheritance by itself leads to no change, and variation leads to no permanent change, unless the variations themselves are heritable. Thus it is not inheritance and variation which bring about evolution, but the inheritance of variation, and this in turn is due to the general principle of gene construction which causes the persistence of autocatalysis despite the alteration in structure of the gene itself. (Muller, “Variation due to change in the individual gene,” <i>American Naturalist</i> 56 (1922) 32-50.</p> <p>“Muller’s hope of 1921 is justly famous among biologists. Unlike many inspired conjectures in the history of science, it had in it nothing woolly.</p>	Brock ch. 1.1, 2.8; Judson p. 30-31.	

	Twenty years later, to explore that conjecture—that is, to discovery and explain the relation ‘between the genes and them,’ the bacterial viruses—developed into one of the two great routes that converged on that ambition ‘to grind genes in a mortar’ and so to find in chemistry and physics the foundation of the phenomenon of genetics.” (Judson p. 31)		
1921	Alexander Fleming discovers lysozyme, his first major discovery before penicillin. Fleming, “On a Remarkable Bacteriolytic Element Found in Tissues and Secretions. <i>Proc. Roy. Soc. B</i> 93 (1922) 306-317.	G-M 1910.1	
1922	M. Lisbonne and L. Carrere Development of an indicator strain for bacterial lysogeny	Brock ch. 7.2	
1923	M. Heidelberger and O.T. Avery The first non-protein antigen, <i>pneumococcus polysaccharide</i>	Brock ch. 9.1	
1925	Jules Bordet coins the term “lysogeny”	Brock ch. 7.2	
1926	John Desmond Bernal develops the reciprocal lattice in X-ray crystallography	Timeline for British Crystallography	
1926	James B. Sumner crystallizes the first enzyme—urease. He will share the Nobel Prize in chemistry with John H. Northrop in 1946.	Nobel Prize website	
1927	Hermann J. Muller shows that radiation causes mutations that are passed on from one generation to the next. This is the first suggestion that inherited traits might be altered or controlled, and it creates a sensation “Man’s most precious substance, the hereditary material which he could pass on to his offspring, was now potentially in his control. X rays could ‘speed up evolution,’ if not in practice at least in the headlines. Like the discoveries of Einstein and Rutherford, Muller’s tampering with a fundamental aspect of nature provoked the public awe. “(Carlson). Muller, “Artificial transmutation of the gene,” <i>Science</i> 66 (1927): 84-87. Muller will receive the Nobel Prize in 1946 for his work on the genetic effects of radiation	Brock ch. 4.11; G-M 251.1; Carlson, E. A. An unacknowledged founding of molecular biology: H. J. Muller’s contribution to gene theory, 1910-36. <i>J. Hist. Biol.</i> 4 (1971) 149-70.	
1927	John Desmond Bernal, a student of Lawrence Bragg at the Royal Institution since Bernal’s graduation from Cambridge in 1923, is appointed Lecturer in Structural Crystallography at Cambridge.	Swann & Aprahamian xxii	
1928	Frederick Griffith discovers “transformation” – a process involving the uptake of genetic material by a living organism. Griffith injects mice with a mixture of live, avirulent, rough <i>Streptococcus pneumoniae</i> Type I, and	Brock ch. 9.3; G-M 251.2	

	heat-killed, virulent, smooth <i>S. pneumoniae</i> Type II, and observes that this mixture leads to the death of the mice. Live, virulent, smooth <i>S. pneumoniae</i> Type II bacteria are recovered from the dead mice, implying that genetic information from the heat-killed virulent strain has somehow been transferred to the avirulent live strain. Frederick Griffith, "The significance of pneumococcal types," <i>J. Hyg. (Camb.)</i> 27 (1928): 113-59		
1928	Pauling publishes "The Coordination Theory of the Structure of Ionic Crystals" in which he proposes 5 rules that scientists can use in solving the structure of molecules. Lawrence Bragg calls the second rule, of "electrostatic valence," "Pauling's Law." [reference needed]	Goertzel & Goertzel p. 57	Offprint
1929	F.M. Burnet and M. McKie Studies on the nature of lysogeny	Brock ch. 7.2	
1929	W. L. Bragg develops Fourier series for crystal structure parameters	Timeline for British Crystallography	
1929	M.H. Dawson and R.H.P. Sia. First in vitro transformation	Brock ch. 9.4	
1930	H. Karstrom Coinage of the terms "adaptive and constitutive enzymes"	Brock ch. 10.2	
1930	John H. Northrop crystallizes pepsin and finds that it is a protein.	Ency. Brit. Ency. On Ezymes (web)	
1930	William Astbury, a student of Lawrence Bragg, is the first to study proteins by X-ray analysis. He applies X-ray analysis to the structure of hair, wool, and related fibers, of which the protein keratin is the principal constituent. He identifies two states: α -keratin and β -keratin.	Tanford & Reynolds 80-81	
1930	First coherent general algebraic analysis of Mendelian population behavior: Sir Ronald Aylmer Fisher, <i>The Genetical Theory of Natural Selection</i> (Oxford: Clarendon Press, 1930).	G-M 253	book
1931	L.E. den Dooren de Jong Discovery of the <i>Bacillus megatherium</i> lysogenic system	Brock ch. 7.3	
1931	Sir Archibald Edward Garrod publishes <i>The Inborn Factors in Disease</i> (Oxford: Clarendon Press, 1931). He argues that chemical individuality can result in individuals having a predisposition to certain diseases, a view that becomes more widely appreciated after the establishment of recombinant DNA methods to identify inherited genetic defects.	G-M 253.2	
1931	Linus Pauling publishes "The Nature of the Chemical Bond. Application of Results Obtained from the Quantum Mechanics and from a Theory of	Goertzel & Goertzel pp. 70-77	Offprint

	Paramagnetic Susceptibility to the Structure of Molecules” in <i>J. Am. Chem. Soc.</i> This is the first exposition of Pauling’s “six rules.”		
1932	Niels Bohr delivers a lecture on <i>Light and Life</i> in which he suggests that life processes are complementary to the laws of chemistry and physics. His speech sparks the interest in biology of Max Delbrück and directs Delbrück’s interests away from physics to biology.		
1932	J.L. Alloway First transformation with a cell-free extract	Brock ch. 9.4	
1932	J. D. Bernal “water & hydroxy ions in structures (with Fowler)”	Timeline for British Crystallography	
1934	I.M. Lewis Proof that acquisition of <i>lac</i> positivity in <i>E. coli mutabile</i> is due to a mutation	Brock ch. 4.4	
1934	M. Schlesinger Purification of phage and demonstration of the presence of DNA	Brock ch. 6.12	
1934	Arthur Lindo Patterson publishes “A Fourier Series method for the Determination of the Components of Interatomic Distances in Crystals.”	Judson 112	Offprint later used by Franklin & Gosling for determining synthesis of DNA Structure A
1934	John Desmond Bernal and Dorothy Crowfoot (Hodgkin) take the first X-ray photograph of a protein structure—crystalline pepsin. They show that crystals of pepsin give an x-ray diffraction pattern, beginning protein crystallography. This may also be the beginning of “structural biology.”(25 years later, in 1959-60, the first complete 3-dimensional structures of proteins, myoglobin and hemoglobin, will be solved by John Kendrew and Max Perutz.)		Offprint, Perutz copy in his nearly complete collection of the offprints of Hodgkin’s papers
1934	Astbury speculates that “fibrous structures might be the basis for the basis for the crystallinity [of pepsin as discovered by Bernal and Crowfoot]: globular proteins in general might be folded from elements essentially like elements of fibrous proteins!” (Tanford & Reynolds 83). “How right he proved to be, but that was much later. Bernal in his biography of Astbury considered this recognition that there might be no radical difference between fibrous and crystalline proteins as one of his great contributions. Overall in Bernal’s words Astbury ‘influenced everybody’s thinking about large biological molecules’ and ‘was the father of all those who since then interpreted other types of fibrous structure...and who can recognize types of twist from the pattern of blurs	Tanford & Reynolds.	

	on rather obscure fields.” (Tanford & Reynolds 83 has references).		
1935	Wendell M. Stanley crystallizes tobacco mosaic virus. <i>Science</i> 81 (1935) 644-645, 1935).	Brock ch. 6.12	
1935	“Target theory”: Nikolai Vladimirovich Timofeeff-Ressovsky, K. G. Zimmer and Max Delbrück, “Ueber die Natur der Genmutation und der Genstruktur,” <i>Nachr. Ges. Wiss. Göttingen, math-fis. Kl., Fachgr. 6, 1</i> (1935): 189-245. This paper represents the debut in genetics of the physicist, Max Delbrück. The three authors “concluded that a mutation is a molecular rearrangement within a particular molecule, and the gene a union of atoms with which a mutation, in the sense of a molecular rearrangement or dissociation of bonds, can occur. The actual calculations of the size of the gene, deduced from calculations on the assumption of a spherical target, were not cogent, as Delbrück wryly admitted in his Nobel Prize lecture, but the entire approach to the problem of mutation and the gene adopted by the three collaborators was highly stimulating to other investigators.” (DSB 18, 922.) This work acknowledges the contributions of Hermann Muller in the laws of radiation genetics. Muller spent the year 1933 working in Timofeeff-Ressovsky’s laboratory in Berlin. 1936	E. Wollman and E. Wollman Lysogeny is due to incorporation of phage into host cell	Brock ch. 7.3	
1936	Muller gives lectures to physics section of meeting of USSR Academy of Sciences, entitled “Physics in the Attack on the Fundamental Problems of Genetics.” In this he discusses two properties of the gene—auto-attraction, or the like-to-like pairing association of homologous chromosomes, and auto-synthesis, “that property of gene which most peculiar and spectacular from the standpoint of chemist.” He makes the analogy of the gene to a crystal and the analogy of the specificity or complexity of the gene to a pattern. The lecture is published in <i>Scientific Monthly</i> 44 (1936) 210- Carlson, Muller 164-65. Though some of these ideas are similar to what Schrödinger will write in <i>What is Life?</i> Muller’s ideas are quickly forgotten and have little influence if any. James D.		

	Watson will take Muller's course on advanced genetics in 1947 but Muller's ideas may have little influence upon Watson's later work.		
1937-39	Bawden and Pirie crystallize tomato bushy stunt virus (several publications)	History of Structural Virology Timeline	
1938	First structural information about a protein provided by X-ray analysis. J. D. Bernal, Isidore Fankuchen, and Max Perutz, "An X-Ray Study of Chymotrypsin and haemoglobin," <i>Nature</i> 141 (19 March 1938): 523-24 This marks the beginning of Perutz's hemoglobin research	Judson, pp. 512-13, 684	Offprint from Perutz papers. Notebook entries in Perutz's lab notebook from the period
1938	Felix Haurowitz in Prague discovers that crystalline deoxyhemoglobin changes in shape and color on reaction with oxygen, suggesting that it is a molecular lung. Haurowitz, F. "Das Gleichgewicht zwischen Hämoglobin and Sauerstoff," <i>Hoppe-Seyl. Z. Physiol. Chem.</i> 254 (1938) 266-72. (In 1949 James D. Watson will take Haurowitz's course on proteins and nucleic acids at Indiana University).	Perutz, <i>Science is Not a Quiet Life</i> , xviii.	Perutz-Haurowitz correspondence
1938	J. D. Bernal becomes Professor of Physics at Birkbeck College in London.	Swann & Aprahamian 235	
1939	Emory L. Ellis and Max Delbrück conduct first experiments on phage, called the "one-step growth experiment," proving that "lysis of the host bacteria and release of the daughter burst of phage indeed occur strictly on the dot [i.e. precise time interval.]" (Judson p. 33).	Brock ch. 6.3	Offprints from Delbrück's personal collection, starting in 1940
1939	Linus Pauling publishes <i>The Nature of the Chemical Bond and the Structure of Molecules and Crystals</i> , his book-length exposition of ideas first developed in 1931	Goertzel & Goertzel p. 77.	
1939 September 1	Germany invades Poland. World War II begins		
1939 September 3	Britain and France declare war on Germany		
1940	Perutz completes his doctoral dissertation at Cambridge; two months later he is deported from England and interned in Canada for several months. He returns to Canada and resumes hemoglobin research		Interruption in laboratory notebooks reflects internment
1941	Beadle and Tatum publish the results of their experiments with the fungus <i>Neurospora crassa</i> . They conclude that ultraviolet light treatment	Brock ch. 5.1	

	<p>somehow causes a mutation in gene that controls the synthesis of an enzyme involved in the synthesis of the essential nutrient. They also show that the defect is inherited in typical Mendelian fashion. This leads to the one-gene / one-enzyme hypothesis, opening up the field of biochemical genetics. G.W. Beadle and E.L. Tatum, “Genetic Control of Biochemical Reactions in <i>Neurospora</i>,” <i>Proc. N. A. S.</i> 27 (1941): 499-506. Beadle and Tatum will share the Nobel Prize with Joshua Lederberg in 1958 for their researches on the mechanism by which the chromosomes in the cell nucleus transmit inherited characters. The "one gene-one enzyme" dogma has since been modified slightly to state that one gene directs the synthesis of one polypeptide—one protein or protein component since it is now known that some proteins are comprised of more than one polypeptide subunit, and that two or more genes may contribute to the synthesis of a particular protein. In addition some products of genes are not enzymes per se but structural proteins.</p>	Judson, pp. 189, 661; G-M 254.3	
1941	<p>Fritz Albert Lipmann discovers co-enzyme A and its importance for intermediary metabolism, and publishes it in “Metabolic Generation and Utilization of Phosphate Bond Energy” (<i>Advances in Enzymology</i> 1 [1941]: 99-162). This discovery illuminates “the process by which cells make available the energy to drive their manufacturing processes” (Judson, p. 245). Lipmann will share the 1953 Nobel Prize in Medicine/Physiology. In his Nobel Lecture (1953) he will speak “very tentatively” of the first clues that “may foreshadow” extension of his concept to proteins and nucleic acids.</p>	Judson, pp. 246-48

1941 December 7	Japan’s attack on Pearl Harbor causes the United States to declare war on Japan. Within days Germany and Italy declare war on the United States		
1941	Bernal and Fankuchen show that tomato bushy stunt virus (TBSV) and tobacco mosaic virus (TMV) give clear X-ray diffraction patterns. Bernal and Fankuchen, <i>J. Gen. Physiol.</i> 25 (1941) 111-146	History of Structural Virology Timeline	
1943	S.E. Luria and M. Delbrück demonstrate via the fluctuation test that mutational alterations occur randomly and before exposure to exogenous mutagenic influences, and that inheritance in bacteria is subject to natural selection. They perform the first quantitative study of mutation in bacteria. Luria, S. E. and Delbrück, M. “Mutations of bacteria from virus	Brock ch. 4.8**; Judson p. 37	Offprint from Delbrück’s collection; several by Luria & Delbrück from this period

	sensitivity to virus resistance.” <i>Genetics</i> 28 (1943) 491-511. Alfred Hershey joins the “phage group” at this time.		
1944	Erwin Schrödinger publishes <i>What is Life? The Physical Aspect of the Living Cell</i> (Cambridge: University Press, 1944), a work speculating about the physical basis of biological phenomena. The work influences the young James D. Watson and others. Actually the book is a popularization of ideas developed by Delbrück in his paper with Timofeeff-Ressovsky in 1935. Brenner points out a fundamental mistake in Schrödinger’s understanding of how genes would operate: “Anyway, the key point is that Schrödinger says that the chromosomes contain the information to specify the future organism and the means to execute it. I have come to call this ‘Schrödinger’s fundamental error.’ In describing the structure of the chromosome fibre as a code script he states that. ‘The chromosome structures are at the same time instrumental in bringing about the development they foreshadow. They are code law and executive power, or to use another simile, they are the architect’s plan and the builder’s craft in one.’ [Schrödinger, p. 20,]. What Schrödinger is saying here is that the chromosomes not only contain a description of the future organism, but also the means to implement the description, or program, as we might call it. And that is wrong! The chromosomes contain the information to specify the future organism and a description of the means to implement this, but not the means themselves. This logical difference was made crystal clear to me when I read the von Neumann article [Hixon Symposium] because he very clearly distinguishes between the things that read the program and the program itself. In other words, the program has to build the machinery to execute itself.” (Brenner, <i>My Life</i> , 33-34)	Judson, pp. 29, 32, 42, 77, 87-88, 250-51, 275, 375	Letter from Perutz to Manny Delbrück concerning Perutz’s review of this book in which Perutz explains how some of the reputation of the volume may not be deserved.
1944	The transforming principle is DNA: publication of Oswald T. Avery, C. MacLeod, and M. McCarty, “Studies on the Chemical Nature of the Substance Inducing Transformation of Pneumococcal Types. Induction of Transformation by a Desoxyribonucleic Acid Fraction Isolated from <i>Pneumococcus</i> Type III,” <i>J. Exp. Med.</i> 79 (Feb. 1944): 137-58	Brock ch. 9.5** Judson, pp. 16-18, 19-22, 38-45, 696 G-M 255.3	Offprint from Hotchkiss
1944	G.W. Beadle and V.L. Coonradt First complementation test	Brock ch. 5.1	
1944	C.H. Gray and E.L. Tatum First biochemical mutants in <i>E. coli</i> K-12	Brock ch. 5.2	

1945	<p>Speaking of Avery's paper on the transforming principle, Hermann J. Muller surmises that, "There were, in effect, still viable bacterial 'chromosomes' or parts of chromosomes floating free in the medium used. These might, in my opinion, have penetrated the capsuleless bacteria and in part at least have taken root there. . . .A method appears to be provided whereby the gene constitution of these forms can be analyzed, much as in the cross-breeding tests on the higher organisms. However, unlike what has so far been possible in higher organisms, viable chromosome threads could also be obtained from these lower forms for in vitro observation, chemical analysis, and determination of the genetic effects of treatment." (quoted by Judson p. 31)</p> <p>Writing in the forward to Muller's <i>Studies in Genetics</i> () p. 5, Joshua Lederberg calls Muller's statement "an incredibly unconventional interpretation that is now the basic idea in this field." Muller, "The Gene," <i>Proc. Roy. Soc., B</i>, 134 (1947) 1-37.</p>

1949	S.S. Cohen First studies on phage biochemistry	Brock ch. 6.12	

1949 June	<p>Sven Furberg, working at Birkbeck College, London, publishes his PhD dissertation typed in about 6 copies: <i>An X-ray Study of Some Nucleosides and Nucleotides</i>. “Furberg, reasoning with marked brilliance and luck from data that were meager but included his own x-ray studies, got right the absolute three-dimensional configuration of the individual nucleotide: where Astbury had set sugar parallel to base, Furberg, in what he called the standard configuration, set them at right angles. As a structural element, that standard configuration was a powerful help. ‘Furberg’s nucleotide—correcting Astbury’s error—was absolutely essential to us,’ Crick told me. Furberg went on to draw a couple of models of DNA, one of which was a single chain in helical form with the bases sticking out flat and parallel to each other, rising 3.4 angstroms from one to the next, eight nucleotides making one complete turn of the screw in about 27 angstroms. Plausible physically, this helix had too little in it; it failed to account for the density of DNA. Furberg stopped building models and published his results in June of 1949—in his doctoral dissertation. . . .</p> <p>“Over the next three years, Furberg’s results appeared piecemeal in a series of papers. From his thesis, his models were well known to Randall’s group at King’s College. . . .Otherwise, Furberg’s models remained almost unnoticed—even by Bernal, who wrote, in 1968, that they had contained ‘the key to the whole double helix story’ and blamed himself for letting ‘the opportunity slip’; Furberg at last got his helical model into print in <i>Acta Chemica Scandinavica</i> late in 1952, in time for Watson and Crick to cite it in the notes to their announcement of the successful solution the next spring.” (Judson, <i>Eighth Day of Creation</i>, 94)</p>	Judson p. 94	Furberg’s personal copy of the dissertation.
1949	<p>Perutz publishes “An X-Ray Study of Horse Methaemoglobin. II,” <i>Proc. Roy. Soc. London A</i> 195 (1949): 474-99. It contains Perutz’s complete three-dimensional Patterson synthesis of methemoglobin of horse.</p> <p>“During the war I used the nights when I was on duty fire watching in the Cavendish Laboratory to take X-ray pictures throughout the night, getting up from my camp-bed every two hours to change films. Two assistants...shared with me the excruciating tedious and eye-straining job of indexing the reflections and measuring their intensities visually again a scale made by exposing the same reflection from a standard anthracene</p>	Judson, p. 525— “supreme importance”	

	<p>crystal for different times. The London firm that had calculated Dorothy Hodgkin's three-dimensional Fourier of penicillin [Comrie's Scientific Computing Service] did the Fourier summation, using punched card computers of the Hollerith type.</p> <p>When the Patterson finally emerged after years of hard work. . . .” (Perutz, <i>Science is not a quiet life</i>, 39)</p>		
<p>1949 September 20</p>	<p>At the Hixon Symposium in Pasadena, California John von Neumann speaks on <i>The General and Logical Theory of Automata</i>. Within this speech he compares the functions of genes to self-reproducing automata. “For instance, it is quite clear that the instruction <i>I</i> is roughly effecting the functions of a gene. It is also clear that the copying mechanism <i>B</i> performs the fundamental act of reproduction, the duplication of the genetic material, which is clearly the fundamental operation in the multiplication of living cells. It is also easy to see how arbitrary alterations of the system <i>E</i>, and in particular of <i>I</i>, can exhibit certain typical traits which appear in connection with mutation, which is lethality as a rule, but with a possibility of continuing reproduction with a modification of traits.” (pp.30-31). Sydney Brenner reads and is influenced by this brief discussion of the gene within the context of information when the Hixon Symposium is published in 1951. Jeffress, Lloyd A. (ed.) <i>Cerebral Mechanisms in Behavior</i>. The Hixon Symposium. New York: John Wiley, 1951. “The brilliant part of this paper in the <i>Hixon Symposium</i> is his description of it takes to make a self-reproducing machine. Von Neumann shows that you have to have a mechanism not only of copying the <i>machine</i>, but of copying the <i>information</i> that specifies the machine. So he divided the machine—the <i>automaton</i> as he called it—into three components; the functional part of the automaton, a decoding section which actually takes a tape, reads the instructions and builds the automaton; and a device that takes a copy of this tape and inserts it into the new automaton”. Brenner, <i>My Life in Science</i>, p. 33: “I think that because of the cultural differences between most biologists on the one hand, and physicists and mathematicians on the other, it had absolutely no impact at all. Of course I want’ smart enough to really see then that this is what DNA and the genetic code was all about. And it is one of the ironies of this entire field that were you to write a history of ideas in the whole of DNA, simply from the</p>		

	documented information as it exists in the literature—that is, a kind of Hegelian history of ideas—you would certainly say that Watson and crick depended upon von Neumann, because von Neumann essentially tells you how it's done. But of course no one knew anything about the other. It's a great paradox to me that in fact this connection was not seen.” (Brenner, My Life 35-36).

1950	A. Lwoff and A. Gutmann Discovery of the nature of lysogeny; coinage of the word “prophage”. Demonstrates that “phage production by lysogenic bacterial is a cellular event rather than a population event” (Brock p.4). Lwoff, A. & Guttman, A. “Recherches sur <i>Bacillus megatherium</i> lysogène,” <i>Ann. Inst. Pasteur</i> 78 (1950) 711-39.	Brock ch. 7.4**	
1950	A. Lwoff, L. Siminovitch, and N. Kjeldgaard Lysogenic cultures can be induced by radiation	Brock ch. 7.4	
1950	J. Lederberg First constitutive mutants of <i>lac</i>	Brock ch. 10.6	
1951 January	Franklin arrives at King's College, London. Randall arranges for Gosling to work with her.		

1951 February	Gosling starts notebook of work on DNA with Franklin. This extends to late 1953.		Gosling's notebook
1951 February	The first Ferranti Mark I version of the Manchester University machine is delivered to Manchester University. The Mark I is the first commercially produced electronic digital computer to be delivered to a customer.		
1951 February – June	Wilkins & Gosling send note to “Nature”: DNA bases are at right angles to the fiber axis and separated by distance of 3.4Å. Observation noted of “unusual stretching phenomenon with fibres which suggests that these long molecules may be extended into a second form.”		
1951 March 31	UNIVAC I, serial 1, is signed over to the United States Census Bureau. The official dedication occurs on June 14, 1951. Excluding the unique BINAC, UNIVAC I is the first electronic digital computer to be commercially manufactured in the United States. Its development precedes the British Ferranti Mark I, but this machine is actually delivered to its first customer one month earlier than UNIVAC I. Though the United States Census Bureau owns UNIVAC I, serial 1, Eckert-Mauchly division of Remington Rand retains it in Philadelphia for sales purposes, and does not actually install it at government offices for twenty-one months.		
1951 May	Wilkins and Gosling publish the first account of their studies of the structure of DNA using high quality samples obtained from Rudolf Signer. Wilkins, Gosling, & Seeds, W. E. Physical studies of nucleic acid. Nucleic acid: An extensible molecule? <i>Nature</i> 167 (May 12, 1951).. 7pp.	Olby 332-35	
1951 Spring	Wilkins & Stokes attribute this to a helical structure; Watson arrives in Cambridge to work at MRC Molecular Biology unit under Perutz.	“Double Helix”	
1951 June (?)	Pauling and his crystallographer, R. B. Corey, announce the α -helix structure for α -keratin. This is the first discovery of a helix structure for a biological molecule. Pauling, Corey, and Branson, “The Structure of Proteins: Two Hydrogen-Bonded Configurations of the Polypeptide Chain”, <i>Proc. Nat. Acad. Sci. USA</i> 37 (1951) 205-11.	Judson 88-89; Olby 278-87; Perutz, Science, 45-46	Offprint inscribed to Perutz; carbon copy typescript of paper on alpha helix corrected by Pauling, “Stable Configurations of Polypeptide Chains” (1952) sent to Perutz.
1951 July 9-12	At the second English electronic computer conference held at Manchester J. M. Bennett and John Kendrew present the first report on the application of an electronic digital computer to computational biology, using the EDSAC to compute the Fourier syntheses of the x-ray	Origins of Cyberspace	

	crystallography of myoglobin. [reference needed]		
1951 September	Franklin and Gosling, working with Ehrenburg-Spear micro-focus X-ray tube at King's College, take photographs of selected regions of single fibers of Signer DNA. Increasingly exact Patterson of A and B forms are achieved. They observe the transition from crystalline A to non-crystalline B when hydration is increased.	Judson 111-12 “Nobody one had ever done a fibre structure this way before”	Offprint of 1934 paper by Patterson in Rosalind Franklin papers; Gosling notebook
1951 September	Bruce Fraser, a collaborator with Rosalind Franklin, distributes his typed thesis entitled <i>The Application of Infra-Red Spectroscopy to Biological Problems</i> .		Thesis; Fraser's copy (one of two known)
1951	At a seminar at Cold Spring Harbor, Barbara McClintock gives her first public presentation of “transposable elements” in maize genetics: “Chromosome Organization and Genic Expression,” <i>C. S. H. Symp. Q. Biol.</i> 16 (1951) 13-47. Her work is little understood at the time. In 1983 McClintock will receive the Nobel Prize (Medicine / Physiology) for her discovery of mobile genetic elements	Judson, p. 445, 679	Offprint (?)
1951	V. Freeman Discovery of lysogenic conversion in <i>Corynebacterium diphtheriae</i>	Brock ch. 8.9	
1951	<p>Aaron Novick and Leo Szilard modify the Luria/Delbrück method for estimating mutation rates (see 1943) using the <i>chemostat</i>, a continuous culture device of their invention. “With the <i>cheomostat</i>, one maintains a steady-state population of bacteria and assesses the fraction of mutants at various times. With constant conditions, the fraction of mutants increases linearly (assuming the mutants grow at the same rate as the parent), and the slope of the line gives the mutation rate directly.” (Brock p. 62) Novick & Szilard, “Experiments on Spontaneous and Chemical Induced Mutations of Bacteria Growing in the Chemostat”. <i>Cold Spring Harbor Symp. Quant. Biol.</i> 16 (1951) 337-343.</p> <p>“A less direct influence [on the development of molecular biology] was the distinguished and passionately intelligent Hungarian physicist Leo Szilard, who in the nineteen-thirties had been the first to envision the possibility that sustained nuclear fission, a chain reaction, could work and cause an explosion, and the first to urge that the United States should try</p>		Szilard notebooks, typescripts, etc.; some letters from Delbrück to Szilard commenting on Szilard's experimental work.

	to make an atomic bomb. Szilard wrote the letter about the idea that Einstein signed and that was read to Roosevelt in 1939. Szilard worked on the atomic project that the University of Chicago through the war; afterwards, in reaction against the weapons and against the big-money, big-team physics he had been instrumental in creating, he turned to biology and also to campaigning within the international scientific community for disarmament—for example, through the Pugwash conferences, which he helped to found. In 1947 Hutchins gave Szilard the physicist an appointment as professor of biology and sociology. In the early years of molecular biology, Szilard was an erratic if interesting experimenter and theorist, a cross-pollinator of ideas an effective critic of others' work, an intellectual and ethical inspiration to younger scientists.” (Judson p. 32).		
1951 November- 1952	<p>Bruce Fraser builds a model of B-form DNA with the following features:</p> <ol style="list-style-type: none"> 1) 3 chains 2) 3.4Å stacking of bases 3) hydrogen bonding of bases between polynucleotide chains 4) Planar arrangement of hydrogen bonds 5) Helical arrangement of chains with 34 degree pitch 6) Nucleotide conformation as indicated by Furberg 7) Phosphates on outside <p>(all features correct except 1)</p>	Judson 116(?)	Thesis; also Fraser's copy; extensively corrected galley proofs of article, “The Infra-Red Spectra of Biologically Important Molecules” (1952-53?). Published in <i>Progress in Biophysics</i> III
1951 November 21	Colloquium of King's. Franklin reviews preliminary results of A-B transition (with photos)	Judson 118-121, Olby 348-51, Double Helix 68-74	Franklin's original photos and notes
1951 November 22	Franklin's notes for her address to the Colloquium contain broadly the same points as her later Fellowship report (February 1952)	Judson 124-5, Double Helix 75-80	Franklin's original notes (?)
1951	E.M. Lederberg Discovery of bacteriophage <i>lambda</i>	Brock ch. 7.5	
1952	Perutz and Bragg publish a series of papers on hemoglobin structure: “Arrangement of Polypeptide Chains in Horse Methaemoglobin” (with E. R. Howells), <i>Acta Crystallographica</i> 5 (Jan. 1952): 136-41; “The External Form of the Haemoglobin Molecule. I,” <i>ibid.</i> 5 (March 1952):	Judson, pp. 528-29, 533-34, 685-66; Perutz, <i>Science</i> is not a quiet life, 42-45	Offprints from Perutz

	277-83; "The External Form of the Haemoglobin Molecule. II," <i>ibid.</i> 5 (May 1952): 323-28; "The Structure of Haemoglobin," <i>Proc. Roy. Soc. London A</i> 213 (1952): 425-35		
1952	Joshua and Esther Lederberg develop replica plating for indirect selection. Lederberg & Lederberg, "Replica Plating and Indirect Selection of Bacterial Mutants," <i>J. Bact.</i> 63 (1952) 399-406. "Genetic traits that can be readily classified by replica plating include antibiotic-sensitivity, responses to phage (as in phage typing), fermentation characters, nutritional requirements, or any characteristic for which a selective or indicator agar medium can be devised." (Brock pp. 65-66)	Brock ch. 4.10	Offprint (?)
1952	A.H. Doermann Discovery of the eclipse phase in phage reproduction	Brock ch. 6.12	
1952	The so-called "Waring blender experiment," described in Alfred D. Hershey and Martha Chase's paper "Independent Functions of Viral Protein and Nucleic Acid," (<i>J. Gen Physiol.</i> 36 [1952]: 39-56) demonstrates that only the DNA of phage enters the cell in significant amounts	Brock ch. 6.13; G-M 256; Judson, p. 108**	Offprint
1952 January - February	Franklin gives lecture series on X-ray analysis of biological molecules		Complete manuscript of lectures in original envelop
Get date	John Bennett and John Kendrew publish the first paper in a scientific journal on the application of an electronic computer to computational biology. An expansion of a briefer summary published in the Manchester University Computer Conference <i>Proceedings</i> (1951), it represents a more thorough presentation intended for x-ray crystallographers. It must have been submitted almost immediately after the Manchester Conference since it was received by <i>Acta Crystallographica</i> on July 28, 1951. "Programmes have been devised for computing Patterson and Fourier synthesis in two and three dimensions with the EDSAC. An outline of the methods used is given and future possibilities are discussed. At present a two-dimensional summation of about 400 independent terms for about 2000 points takes 1 ½ hr.; a three-dimensional summation of 2000 terms for 18,000 points takes 9 hr. A method is described whereby the EDSAC, without special modification, can be made to print results directly in contour form with considerable economy in time." (p.[109]). "The computation of Fourier syntheses with a digital electronic calculating machine" <i>Acta Crystallographica</i> 5 (1952): 109-116.	Origins of Cyberspace 745	Journal volume

1952 February (check month)	Crick, Cochran & Vand paper on theory of helical diffraction published. The Structure of Synthetic Polypeptides. I. The Transform of Atoms on a Helix.” <i>Acta Crystallographica</i> 5 (1952) 109-116. . “Crick’s full mathematical treatment . . . of the x-ray patterns produced by helical molecules generally” (Judson, <i>Eighth Day of Creation</i> , p. 129). The paper gives the formulae for the Fourier transforms of a number of helical structures, and provides evidence that the structure of a synthetic polypeptide was based on the alpha helix of Pauling and Corey. “It was, I believe, the first fairly conclusive experimental evidence for the existence of a helical structure at the molecular level. . . . The main value of this work, seen in retrospect, is that it was a first step on the road to the discovery of the structure of DNA by Jim Watson and Crick ” (Cochran, “This week’s citation classic,” <i>Current Contents</i> [May 18, 1987]: 16).		Offprint
1952 (circa)	Working with Watson and Crick, Jerry Donahue writes an anonymous, undated satire of their attempt to solve molecular structures: <i>The Structure of Globloglobin</i> by J. Briekopf, Inst. of Astrobotany. The title suggests Crick’s work on hemoglobin for his doctoral dissertation rather than DNA.		Original carbon copy typescript with manuscript drawings, from Perutz’s archive
1952 February	Franklin submits her Fellowship report on the first year’s work at King’s. Repeats the points noted for the Nov. 1951 colloquium: <ul style="list-style-type: none"> 1) general features of A and B forms suggest helical structure 2) 27Å layer line spacing in A-form probably = 1 turn of a helix 3) Conclusion: “The results suggest a helical structure (which must be very closely packed) containing probably 2,3, or 4 coaxial nucleic acid chains per helical unit and having the phosphate groups near the outside.” 	Judson p. 120	
1952	Luria and M.L. Human, and independently Weigle, describe a non-genetic host-controlled modification system in bacteriophage that ultimately leads to the study of bacterial systems of restriction and modification. These studies in turn eventually led to the discovery of restriction endonucleases, essential tools in the development of genetic	Brock ch. 6.15; molecular- biologist.com timeline	

	engineering methodologies.		
1952	N. Zinder and J. Lederberg discover transduction, the transfer of genetic information by viruses, in <i>Salmonella</i>	Brock ch. 8.1	
1952	"Dounce had already written coding papers." (Brenner, <i>My Life in Science</i> 30). A. L. Dounce, Duplicating mechanism for peptide chain and nucleic acid synthesis. <i>Enzymologia</i> 15 (1952) 251-53.		
1952 April 18	Franklin records details of A-form photograph showing some double orientation; this will lead her to doubt that the A-form is helical	Olby 369-76	
1952 May 1	The Royal Society holds a meeting on Protein Structure. Franklin shows her photographs; she takes anti-helical view of A-form DNA.	Judson 131-2; Olby 369, Double Helix 121-2	
1952 May 2-6	Franklin takes more photographs of B-form. No. 51 is finest yet, showing the characteristic X-shaped "Maltese cross" clearer than before	Judson 135-36, Olby 369-76	Original print and negative
1952	William Hayes discovers that recombination in <i>E. coli</i> is a unidirectional process. Hayes, W. "Recombination in Bact. coli K-12: Unidirectional Transfer of Genetic Material," <i>Nature</i> 169 (1952) 118-19.	Brock ch. 5.5	
1952 June 19	Franklin writes to J. D. Bernal about a possible transfer to his department at Birkbeck	Judson 137-38	
1952 July 2	Franklin writes "Notes on first cylindrical Patterson...there is no indication of a helix .of diameter 11Å...If a helix, there is only one strand...If a helix, it is v. far from continuous uniform density...."	Judson 144	
1952 July 18	Franklin & Gosling send out a black-edged card announcing "The death ...of DNA Helix (crystalline). A memorial service will be held...It is hoped that Dr. M.H.F. Wilkins will speak in memory of the late Helix."	Judson 144	Original autograph card from Klug
1952 Late July	Crick tries to prove base-pairing experimentally but equipment is inadequate	Judson 144-45	Original autograph manuscript notebook by Crick
1952 late (check date)	Furberg publishes his helical model of DNA in <i>Acta Chemica Scandinavica</i> . Watson and Crick will cite this in the bibliography to their first paper on the double helix.		Offprint and various letters
1952 October-November	Crick breaks off work on his thesis to finish work on the "coiled coil" structure of the Alpha helix of keratin. He sends results to <i>Nature</i> with hope of beating Pauling to publication.	Judson 152-53	Letter, etc. Also have photos on alpha keratin? With notes by Pauling 12-53; autograph manuscript by Crick of

			expansion paper on same subject (1953).
1952 End of November	<p>Franklin and Gosling prepare two papers for publication:</p> <ol style="list-style-type: none"> 1) The influence of water on the A-B transition 2) Preliminary Patterson results on the A structure <p>Randall asks each of his team to summarize their work for a report to the MRC Biophysics Committee. The Report is not confidential</p> <p>Franklin's report contains the following:</p> <ol style="list-style-type: none"> 1) A –B transition is marked by a change in distance from 28Å to 34Å (approx. 20%) along fiber at which the structure begins to repeat. 2) Dimensions of the unit cell in A-form 3) Crystals of A-form are face-centered and monoclinic C2 (she does not, now or later, draw any conclusion from this regarding the number and direction of chains). <p>When the MRC Biophysics Committee visits King's Perutz, from the MRC Unit at Cambridge, receives a copy of this Report. (<i>See February 1953, 2nd wk, below</i>).</p>		<p>Photocopy of report and Perutz's large file on the fall-out after <i>The Double Helix</i> is published, caused by Watson's mentioning of his disclosure of this information to Watson.</p> <p>Franklin papers</p>
1952 Mid-Late December	Peter Pauling tells Crick and Watson that his father Linus has written to tell him that Linus has a structure for DNA		
1953 Early January	Franklin announces that she will leave King's for a position at Birkbeck College in Bernal's Department. Wilkins, greatly relieved, plans development of a group to take over the study of DNA. Herbert Wilson joins (?)		Wilson lab notebooks, and manuscript reports; include his notes of a talk by Franklin, Gosling, and Wilkins on DNA in 1953, etc.
1953 January 19	Franklin considers calculation for 3-D Patterson, and what structure it might be showing. Possibility of a figure-8 is noted. Also a brief reference to difficulties with "reconciling nucleotide sequence with	Judson 155	

	Chargaff's analysis." Notes end with plans for a figure-8 model. Also notes refer also to diads in the structure relating 2 polynucleotide chains- but she does not realize that means the molecule has 2 chains.		
1953 late January	Watson writes up his bacterial work and a report on the helical structure of TMV	Judson 156, Double Helix 158	
1953 January 26	Franklin plans to build model based on her proposed figure 8 structure of DNA. At this time she shows Wilkins her superb B-form photo no. 51 (taken the previous May)		
1953 January 28	<p>Franklin holds her leaving Seminar at King's for her colleagues, and J.D. Bernal of Birkbeck, to review 2 years of work with Gosling on DNA. Wilkins: "Her talk dealt only with A-DNA and was entirely non-helical terms." He asked her about her photo 51: "She replied she believed the B-form was helical and the A was not."</p> <p>At Cambridge Pauling's manuscript concerning his proposed structure for DNA arrives. Pauling sends 1 copy to his son, Peter and another to Sir Lawrence Bragg. When Peter brings his copy in the lab Watson spots crucial mistake. Pauling and Corey, "A Proposed Structure for the Nucleic Acids."</p>	Maddox 191.	
1953 January 30	Watson takes copy of Pauling manuscript to King's and shows it to Franklin. Wilkins interrupts their encounter and later shows Franklin's photo of the B-form to Watson. The information is not new but Watson's understanding, educated by his TMV work, is new. At this meeting Wilkins remarks to Watson that Chargaff's ratios 'could be the key.' Watson agrees.		
1953 January 31	<p>Watson asks Bragg if he can order model components from the Cavendish machine shop. Bragg agrees.</p> <p>Watson's account of Franklin's photo 51 to Crick confirms they have the vital statistics to build a B-form model: photo confirmed 20Å diameter, with a 3.4Å distance between bases. This, plus the repeat distance of</p>		

	34Å, helix slope about 40°, and likelihood of 2 chains not 3 (though Crick thinks 3 is possible) seem to be sufficient.		
1953 February 4	Watson starts model-building with phosphate groups form the central core. He is aware or has forgotten Franklin's certainty that they must be on the outside. Crick suggests the outside and they put them there.		
1953 February 2 nd week	<p>Crick or Watson asks Perutz for a copy of the MRC Biophysics Committee Report, having probably heard about it from Wilkins. Not recognizing the consequences, and being inexperienced in administrative matters, Perutz handed over a copy of the non-confidential report. Reporting work done by Rosalind Franklin, it</p> <p>1) Confirmed data on water content & axial repeat in A and B forms.</p> <p>2) Phosphate groups likely to be exposed on outside</p> <p>3) A-form is monoclinic C2</p> <p>(Monoclinic C2 (face-centered) is the identical space grouping to oxygenated hemoglobin, that Crick is studying for his thesis; he immediately recognizes its significance—DNA must have 2 chains, and they must run in opposite directions.</p> <p>Also, the rotation from one nucleotide to the next must be 36° and not 18° like Watson built. Crick revises the model. Watson works out from Franklin's data on the transition B that the A-form must also have 2 chains.</p> <p>During this same period Franklin writes "Structure B" evidence for 2-chain (or 1 chain helix?")</p>	Judson 164, Olby 375	Perutz file concerning this incident; Franklin notebooks at Churchill College, Cambridge; Gosling/Franklin notebook in Norman archive
1953 February	Linus Pauling and Robert Corey publish their incorrect structure for DNA (and RNA) in "A Proposed Structure for the Nucleic Acids," <i>Proc. N. A. S.</i> 39 (1953): 96-97. Competition with Pauling spurs DNA researchers at the Cavendish Laboratory and King's College, Cambridge to intensify their efforts to discover DNA structure	Judson, pp. 131-35, 657, Maddox 199	Peter Pauling's copy of journal issue, signed.
1953	Pauling and Corey publish a summary of their proposed structure for	Maddox 200	

February 21	DNA in a letter to <i>Nature</i> .		
1953 February 23	Franklin begins helical analysis on “Structure B: Photograph 51. After 2 days she concludes A and B are two-chain helices. She is two steps away from the correct interpretation.1) She did not consider the base-pairing.2) She missed the significance of the C2 space grouping.	Judson 171-72	Original notebook at Churchill College
1953 February 27-28	Crick, Watson and Donohue realize that they can make a structure consistent with the Chargaff ratios. At lunch on February 28 Crick and Watson tell drinkers at the Eagle, “We’ve found the secret of life!”		
1953 March 7	Crick and Watson finish the Double Helix model of DNA structure		
1953 March 12	Watson writes to Delbrück reporting the discovery. Watson will later reproduce the letter in <i>The Double Helix</i> .		Delbrück’s copy of published book.
1953 March	Franklin writes “Molecular Configuration in Sodium Thymonucleate,” illustrating it with her photograph 51. This reports her discovery of “the existence of DNA in 2 forms, and conditions for readily and rapidly changing from one to the other. Its phosphates were on the outside.” (Maddox 195). “Nothing is more ironical than the words Rosalind wrote, inserted by hand into her typescript in order to adapt it to accompany the Watson-Crick paper. The alteration transformed own fundamental findings into a ‘me-too’ effort. The inserted words were: ‘Thus our general ideas are consistent with the model proposed by Crick and Watson.’ So indeed they should have been consistent, considering that the Watson-Crick model was in large part derived from her work. The striking Photo 51 of the B form of DNA appeared as an illustration to her and Gosling’s own paper, with no suggestion that Watson had seen it, let alone been inspired by it. She appended also her comment that the photograph ‘is strongly characteristic . . . of a helical structure.’” (Maddox 211-21)	Maddox 195, 211-12	Original carbon copy typescript corrected in manuscript by Franklin.
1953 March “end of”	Franklin leaves King’s College for Birkbeck		
1953 April 2	Watson and Crick send the manuscript of their paper on the DNA structure to <i>Nature</i> . <i>Nature</i> holds the MS until the King’s papers by Wilkins & Wilson and Franklin & Gosling are ready.		

1953 April 17	Randall, head of the program at King's College, London, writes to Franklin at Birkbeck reminding her that she should not take her DNA work with her. Thus she moves her research to TMV and later poliovirus.	Judson 179, 186-7; Olby 422; Maddox 212-13.	
1953	William Hayes discovers of the role of an infectious factor in <i>E. coli</i> mating.	Brock ch. 5.6	Offprint?
1953	L. Cavalli, J. Lederberg, and E. Lederberg Discovery of F factor in <i>E. coli</i>	Brock ch. 5.6	
1953	M. Cohn and J. Monod discover gratuitous induction and the use of galactoside analogs to study the process of β -galactosidase synthesis	Brock ch. 10.7	
1953	A. Lwoff Important review article on the nature of lysogeny	Brock ch. 7.4	Offprint; Stent's copy
1953	Bertram Bowden's <i>Faster than Thought</i> , one of the earliest widely read books on electronic digital computing, contains an article by J. M. Bennett on "Digital Computation and the Crystallographer," the first widely read account of the use of an electronic digital computer (the EDSAC) for problems in biology.	Origins of Cyberspace	book
1953	Discussion of "controlling elements" in genes: Barbara McClintock, "Induction of Instability of Selected Loci in Maize," <i>Genetics</i> 38 (1953): 579-99	Judson, pp. 445, 679	Offprint
1953 April 25	Discovery of the self-complimentary double helix structure of DNA: James D. Watson and Francis H.C. Crick, "Molecular Structure of Nucleic Acids. A structure for deoxyribose nucleic acid." <i>Nature</i> 171 (1953): 737-38. In this paper they state that, "It has not escaped our notice that the specific pairing we have postulated immediately suggests a possible copying mechanism for the genetic material." "We have also been stimulated by a knowledge of the general nature of the unpublished experimental results and ideas of Dr. M.H.F. Wilkins, Dr. R.E. Franklin and their co-workers at King's College, London."	Brock ch. 9.8; G-M 256.3; Watson & Tooze timeline	Galleys corrected and signed by Watson & Crick. These are the only galleys extant. The archives of the journal <i>Nature</i> were thrown out during a move to new offices in 1953. "thus there was nothing available when Macmillan, the publishing company which owns <i>Nature</i> , sold it own archive to the British Library in 1966." (Maddox 211). Offprint, Perutz copy
1953 April 25	M. H. F. Wilkins, A. R. Stokes and H. R. Wilson, "Molecular Structure of Deoxypentose Nucleic Acids," <i>Nature</i> 171 (1953): 738-40 Provides	Judson, p. 155, 659	In Perutz copy of offprint

	supporting data for Watson & Crick structure		
1953 April 25	R. E. Franklin and R. G. Gosling, "Molecular Configuration in Sodium Thymonucleate," <i>Nature</i> , 171 (1953) 740-41.		Original carbon copy of typescript, with manuscript corrections by R.E.F.
1953 May 1	Delbrück writes to Watson: "... if your structure is true ... then all hell will break loose. ... "		
1953 May 30	How the DNA double helix structure embodies within it the capacity for its own self-replication: James D. Watson and Francis H. C. Crick, "Genetical Implications of the Structure of Deoxyribonucleic Acid," <i>Nature</i> 171 (1953): 964-67	G-M 256.3 (note)	Galleys, signed by Watson & Crick. Offprint, Perutz copy
1953	Further investigation of the structure of DNA. Maurice H. F. Wilkins, W. E. Seeds, A. R. Stokes and H. R. Wilson, "Helical Structure of Crystalline Deoxypentose Nucleic Acid," <i>Nature</i> 172 (1953): 759-62.	G-M 256.4	Offprint Herbert Wilson notebooks and reports
	Crick letter to REF commenting on her DNA work	Maddox 223-24.	Original TLS etc.; see July 25
1953 June 5	Watson presents first general overview of his and Crick's discovery at the Eighteenth Cold Spring Harbor Symposium, on viruses. Watson & Crick, "The Structure of DNA". <i>Cold Spring Harbor Symposia on Quantitative Biology</i> XVIII (1953) 123-31. In preparation for the meeting Delbrück has circulated copies of the "triple-offprint" as required reading beforehand.		offprint
1953 July 25	Franklin and Gosling publish the completed Patterson synthesis of the A-form in <i>Nature</i> . It is entirely consistent with the proposed model—"We suggest that the unit in structure A is, as in Structure B, two co-axial helical chains running in opposite directions." This is the first independent confirmation that the Watson and Crick model is correct.		Offprint; manuscripts related
1953 End	Aaron Klug, having completed his PhD at Cambridge (1952), and a post-doctoral year there, obtains a Nuffield Fellowship to work at Birkbeck in J. D. Bernal's department.		Klug papers
1954	J. Marmur and Rollin Hotchkiss. Discovery of linked markers in pneumococcus transformation	Brock ch. 9.13	Hotchkiss papers
1954	Perutz discovers the heavy atom method will solve the phase problem. Green, D. W., Ingram, V. M., and Perutz, "The structure of haemoglobin. IV. Sign determination by the isomorphous replacement method," <i>Proc. R. Soc.</i> A225 (1954) 287-307.	Perutz, Science is not a quiet life,	***Perutz notebooks. This event occurs in 1953.

1954	Solution of the hemoglobin structure in two dimensions: W. L. Bragg and Max Perutz, "The Structure of Haemoglobin VI. Fourier Projections on the 101 Plane," <i>Proc. Roy. Soc. London</i> A225 (1954): 315-29. "The structure of haemoglobin is a problem of much greater complexity than any other yet attacked by X-ray analysis. Some tentative solutions of the structure have been proposed in the past, but it has been impossible to prove them either right or wrong. What is novel in the present attack on the problem is the certainty of the results." (from the beginning of this paper p. 315)	Judson, pp. 533, 686	Offprint; Perutz's notebooks
1954	B. Rotman and S. Spiegelman There are no precursors in induced enzyme synthesis	Brock ch. 10.7	
1954	François Jacob and Elie Wollman discover zygotic induction.	Brock ch. 7.5	
1954	George Gamov comes up with the idea of a genetic code: "Possible Mathematical Relation between Deoxyribonucleic Acid and Proteins," <i>Det Kongelige Danske Videnskabernes Selskab: Biologiske Meddelelser</i> 22, no. 3 (1954): 1-13. In the fall of 1953 Gamov gave Crick an earlier draft of this paper, entitled "Protein Synthesis by DNA Molecules."	Judson, pp. 265-66	
1954	Linus Pauling wins the Nobel Prize (Chemistry) for his research into the nature of the chemical bond and its application to the elucidation of the structure of complex substances.		
1955	S. Benzer Fine-structure studies on the phage genome and the concept of the cistron	Brock ch. 6.10	
1955	Franklin and Gosling publish the first 3-dimensional Patterson synthesis of DNA Structure A. This is Franklin's last publication on DNA.		Offprints; have manuscript?
1955	Frederick Sanger sequences the amino acids of insulin, the first of any protein. His work "revealed that a protein has a definite constant, genetically determined sequence—and yet a sequence with no general rule for its assembly. Therefore it had to have a code" (Judson, p. 188). Sanger will receive the Nobel Prize in chemistry in 1958. [reference needed]	Judson, pp. 88-89, 188	
1955	Francis Crick publishes the first of his masterworks on protein synthesis, "On Degenerate Templates and the Adaptor Hypothesis: A Note for the RNA Tie Club" (mimeograph)	Judson, pp. 288-94	Signed mimeograph
1955	D.S. Hogness, F. Cohn, and J. Monod There are no precursors in induced	Brock ch. 10.7	Offprint ?

	enzyme synthesis		
1955	<p>Elie Wollman and François Jacob conduct the interrupted mating experiment and discover the concept of fragmentary gene transfer. “This major discovery, which provided the essential clue to the nature of the <i>Escherichia coli</i> mating system, led to the important <i>interrupted mating experiments</i>, in which a high-speed blender was used to separate mating pairs after different periods of time. By separating mating pairs at various times, certain genes were found in recombinants earlier than others. By comparing the order of entry as observed in the blender experiments to the genetic map, it could be shown that the time of transfer correlated with the position on the map. Wollman and Jacob suggested that one could actually use the <i>time of transfer</i> as a means of expressing the genetic map of <i>Escherichia coli</i>, a suggestion that proved to be correct. Interrupted mating subsequently became the basis for the whole system of genetic mapping in <i>Escherichia coli</i>.” (Brock p.95). Wollman & Jacob, “Sur le mécanisme du transfert de matériel génétique au cours de la recombinaison chez <i>Escheria coli</i> K 12,” <i>Comptes rendus</i> 240 (1955) 2449-2451.</p>	Brock ch. 5.7	Offprint ?
1955	Dorothy Hodgkin investigates the structure of vitamin B12	Timeline for British Crystallography	Offprint from Perutz collection; Perutz corresp with Hodgkin
1955	Rosalind Franklin proposes the arrangement of protein subunits in TMV based on X-ray diffraction studies. <i>Nature</i> 175 (1955), 379-381,1955).	History of Structural Virology Timeline	Drafts of RNA-TMV work
1955	Donald Caspar submits his dissertation to Yale, on <i>The Radial Structure of Tobacco Mosaic Virus</i> . It is influential on Watson, Crick and Rosalind Franklin.		Caspar’s copy of his thesis, read by Franklin and returned
1955	Working with Don Caspar’s data on TMV, James Watson and Caspar write a speculative paper on RNA proposing a 10-12 stranded RNA helix. The paper is entitled <i>The Arrangement of Ribonucleic Acid with Tobacco Mosaic Virus</i> . Unsatisfied, they do not publish the paper.	Viruses From Structure to Biology website	Original unpublished carbon copy typescript from Caspar.
1955	Discovery of an enzyme able to catalyze the removal of a terminal phosphate group from ribonucleoside diphosphates: Marianne Grunberg-Manago and Severo Ochoa de Albornoz, “Enzymatic synthesis and breakdown of polynucleotides; polynucleotide phosphorylase,” <i>J. Amer. Chem. Soc.</i> 77 (1955): 3165-66. Ochoa de Albornoz will share the Nobel Prize with Arthur Kornberg in 1959 for artificial synthesis of nucleic	G-M 752.3	Offprint

	acids by means of enzymes		
1956	Discovery of gene inhibitors, activators, modifiers and inducers in maize: Barbara McClintock, "Controlling Elements and the Gene," <i>C. S. H. Symp. Q. Biol.</i> 21 (1956): 197-216	Judson, pp. 445, 679	Offprint
1956	H. Tijo and A. Levan establish that human cells contain 46 chromosomes in "The chromosomes of man", <i>Hereditas</i> 42 (1956) 1-6.	Genome Timeline, yourgenome.org	
1956	M. Demerec and P. Hartman Fine-structure mapping of the genome using transduction	Brock ch. 8.5	
1956	Artificial synthesis of nucleic acids by means of enzymes: Arthur Kornberg, "Enzymic synthesis of deoxyribonucleic acid," <i>Biochim. Biophys. Acta.</i> 21 (1956): 197-98	G-M 752.4	
1956	Vernon Ingram shows that sickle-cell hemoglobin that Linus Pauling had showed involved a chemical change in the protein was a single amino acid change, the conversion of a glutamic acid in a lysine. Ingram invents a "fingerprinting method to show this." This becomes a very valuable tool to investigate the relationship between genes and proteins. Ingram, "A specific chemical difference between the globins of normal human and sickle-cell anaemia haemoglobin," <i>Nature</i> 178 (1956) 792-94.	Brenner, My Life, 53	
1956	Gunther Stent and Max Delbrück deliver the paper "On the Mechanism of DNA Replication," published in McElroy and Glass, eds., <i>A Symposium on the Chemical Basis of Heredity</i> (Baltimore: Johns Hopkins Press, 1957, pp. 699-736). This paper sets out the alternatives for confirming biologically the validity of Watson and Crick's model of DNA replication	Judson, p. 162, 660	Offprint from Delbruck's collection
1956	First announcement in print of Crick's adaptor molecule hypothesis published in M. Wilkins, Molecular structure of deoxyribose nucleic acid and nucleoprotein and possible implications in protein synthesis, <i>Biochem. Soc. Symposia</i> 14 (1956)	Judson, p. 314.	
1956	Crick and Watson propose the subunit structure of spherical viruses. <i>Nature</i> 177, 474-475, 1956.	History of Virology Timeline	Offprint
1956	Donald Caspar observes that X-ray diffraction patterns of TBSV show high degree of symmetry. Caspar, <i>Nature</i> 177(1956) 475-476.	History of Virology Timeline	Klug papers; Caspar correspondence with Rosalind Franklin, etc.
1956	F. Jacob and E. Wollman The origin of Hfr from F+	Brock ch. 5.10	

1956	Few or no restrictions on amino-acid sequences: Sydney Brenner, "On the Impossibility of All Overlapping Triplet Codes," mimeographed report for the RNA Tie Club. This is officially published as "On the Impossibility of all Overlapping Triplet Codes in Information Transfer from Nucleic Acids to Proteins". <i>Proc. Nat. Acad. Sci. USA</i> 43 (1956) 687-694.	Judson, pp. 327, 329, 669; Brenner, My Life, 55	Offprint ?
1956	E. Wollman, F. Jacob, and W. Hayes The <i>E. coli</i> chromosome is a circle	Brock ch. 5.11	
1956	H.V: Rickenberg, G. Cohen, and J. Monod Discovery of galactoside permease	Brock ch. 10.7	
1956	E. Volkin and L. Astrachan Rapidly turning over T2 RNA has a base composition like the phage rather than the host	Brock ch. 10.12	
1956	M.L. Morse, E.M. Lederberg, and J. Lederberg Discovery of <i>gal</i> transduction by <i>lambda</i> and the concept of high-frequency transduction	Brock ch. 8.6	
1956	R.A. Yates and A.B. Pardee Feedback inhibition of uracil biosynthesis	Brock ch. 10.15	
1956	Genetic experiments support the hypothesis that the genetic messages of DNA are conveyed by its sequence of base pairs	Watson & Tooze timeline	
1957 Sept.	Crick delivers his paper "On Protein Synthesis," published in <i>Symp. Soc. Exp. Biol.</i> 12 (1958): 138-63. In it Crick proposes two general principles: 1) The Sequence Hypothesis: "The order of bases in a portion of DNA represents a code for the amino acid sequence of a specific protein. Each 'word' in the code would name a specific amino acid. From the two-dimensional genetic text, written in DNA, are forced the whole diversity of uniquely shaped three-dimensional proteins" (gmn.tigr.org.timeline), and 2) The Central Dogma. "Information is transmitted from DNA and RNA to proteins but information cannot from a protein to DNA. This paper "permanently altered the logic of biology." (Judson)	Judson, pp. 330-333, 669	Prepublication mimeograph distributed to participants in advance of the meeting, signed by Crick, from Rollin Hotchkiss; also offprint from first printed version (book)
1957	H. Vogel First presentation of the concept of enzyme repression	Brock ch. 10.8	
1957	W. Arber, E. Kellenberger, and J. Weigle Transducing <i>lambda</i> phage are defective	Brock ch. 8.6	
1957	L. Gorini and W.K. Maas Arginine specifically inhibits an enzyme involved in its own synthesis	Brock ch. 10.8	
1957	Robert Langridge, a doctoral student under Wilkins, is the first to apply a stored-program digital computer (IBM 650) to DNA analysis (PhD.	http://www.cgl.ucsf.edu/home/rl/	

	thesis)		
1957	R.A. Yates and A.B. Pardee: Uracil specifically inhibits an enzyme involved in its own synthesis	Brock ch. 10.8	
1957	Brenner's "dazzlingly simple" proof that the genetic code is not of the overlapping type—"the first concrete achievement of decoding" (Ycas, <i>The Biological Code</i> , p. 42). Brenner's proof consisted in demonstrating logically that 64 triplets were insufficient to code the known sequences of amino acids. "Brenner's paper had the consequence that without overlapping there were few restrictions, perhaps none, on amino-acid sequences" (Judson 227) "On the impossibility of all overlapping triplet codes in information transfer from nucleic acid to proteins". <i>Proc. Nat. Acad. Sci.</i> 43 (1957). 687-694.	Judson, 327-29	
1958	Jack Kilby of Texas Instruments conceives of the integrated circuit and constructs a basic prototype.		
1958	Independently of Kilby, Robert Noyce of Fairchild Semiconductor invents a process that makes it practical to manufacture integrated circuits. Noyce will eventually be regarded as the inspiration for "Silicon Valley		
1958	John Kendrew founds the <i>Journal of Molecular Biology</i>		
1958	Synthesis of polynucleotides: Peter Thomas Gilham and Khorana, Har Gobind, "Studies on polynucleotides. I. A new and general method for the chemical synthesis of the C ₅ '-C ₃ ' internucleotide linkage. Synthesis of deoxyribodinucleotides," <i>J. Amer. Chem. Soc.</i> 80 (1956): 6212-22. Khorana shared the Nobel Prize in 1968 for techniques he established for the synthesis of polynucleotides	G-M 752.6	
1958 April 16	Rosalind Franklin dies of ovarian cancer; Aaron Klug assumes head of Virus Research Project at Birbeck By this time the general picture of the structure of TMV is complete. Franklin had been scheduled to speak in Bloomington, Indiana at the 50 th anniversary of the American Phytopathology Society concerning her work on TMV. Donald Caspar is asked to speak in her place. He asks Aaron Klug to co-author the paper, thus beginning their long collaboration. It leads to Franklin's last, posthumous publication: Franklin, Caspar, and Klug. "The Structure of Viruses as Determined by	Klug, Nobel lecture 95; Gregory Morgan web reference cited below	Franklin's numerous manuscripts on TMV, etc, Klug and Caspar manuscript. Plus the book.

	X-ray Diffraction” IN: <i>Plant Pathology: Problems and Progress</i> 1908-58. Madison, 1959		
1958 April 18	Perutz delivers an eloquent speech to the Medical Research Council on “Molecular Biology” after which the council decides to build the MRC Laboratory of Molecular Biology at Cambridge. This is an early discussion of what “molecular biology” is.	Perutz papers	Original 6-page double-spaced typescript, corrected.
1958	F. Jacob and E. Wollman The episome concept	Brock ch. 7.7	
1958	E. Kellenberger, A. Ryter, and J. Sechaud Electron microscopy of the <i>E. coli</i> nucleoid	Brock ch. 3.9	
1958	Meselson and Stahl use provide evidence that DNA acts as a template when being copied in replication: Matthew S. Meselson and Franklin W. Stahl, “The Replication of DNA in <i>Escheria coli</i> ,” <i>Proc. Nat. Acad. Sci.</i> 44 (1958): 671-82	Brock ch. 9.15; G-M 256.6	Offprint
1958	Proof that DNA replication involves separating the complementary strands of the double helix	Watson & Tooze timeline	
1958	Isolation of first enzyme (DNA polymerase I) that makes DNA in a test tube	Watson & Tooze timeline	
1958 May	The “PaJaMo” experiment of Arthur Pardee, François Jacob and Jacques Monod “broke the impasse in Crick and Brenner’s comprehension of how information in the sequence of bases in DNA came to be expressed as a sequence of the amino acids in protein, and thus led to the theory of the messenger and the solution of the coding problem” (Judson 390) Pardee, Arthur B. (1921-), Jacob, François (1920-), and Monod, Jacques (1910-76). Sur l’expression et le rôle des allèles “inductible” et “constitutif” dans la synthèse de la β -galactosidase chez des zygotes d’ “ <i>Escherichia coli</i> .” Offprint form <i>C. r. des séances de l’Académie des Sciences</i> 246 (28 May 1958. This was recorded definitively in “The Genetic Control and Cytoplasmic Expression of ‘Inducibility’ in the Synthesis of β -galactosidase by <i>E. coli</i> ,” <i>J. Molecular Biology</i> 1 (1959): 165-78	Brock ch. 10.9; Judson, pp. 390-402, 676	offprint
1959-60	John Kendrew solves first high resolution structure of a protein (myoglobin). [Get precise reference and date]		
1959	B.N. Ames and B. Garry Coordinate repression	Brock ch. 10.13	

1959	Sydney Brenner develops negative staining method for electron microscopy that had been invented in 1955 by Hall. Brenner, S. & Horne, R. W. "A Negative Staining Method for High Resolution Electron Microscopy of Viruses". <i>Biochim. Biophys. Acta</i> 34 (1959) 103-110. "This . . . took electron microscopy out of the hands of the elite and basically gave it to the people. It gave all the people working in virology a tool that they could use, and really wiped out the profession of electron microscopy in a biological laboratory, because anyone could do it. I think this was important because visualizing phages and sub-phage particles under the microscope generated the ability to begin to think about macromolecular assemblies. And of course the molecular biology of the cell is really about how bunches of molecules get together and interact." (Brenner, My Life 56-57)	Brenner, My Life, 56-57.	
1959	F. Jacob and E.A. Adelberg Isolation of the first F prime factor	Brock ch. 5.12	
1959	F. Jacob and J. Monod Distinction between regulatory and structural genes	Brock ch. 10.10	
1959	A. Kleinschmidt Technique for electron microscopy of DNA	Brock ch. 3.9	
1959	P. Doty , J. Marmur, and N. Sueoka Density and melting temperature of DNA depend on base composition	Brock ch.9.13	
1959	Discovery of an enzyme (RNA polymerase) that makes RNA chains on the surface of single-stranded DNA	Watson & Tooze timeline	
December 1959	Crick and Brenner publish <i>Some Footnotes on Protein Synthesis: A Note for the RNA Tie Club</i> (mimeographed) containing Crick's concept of the ribosome	Judson, pp. 412, 676	Mimeograph, signed by Crick
1960	P. Doty et al. Reformation of DNA double helix by slow cooling	Brock ch. 9.13	
1960 February	Perutz and Kendrew determine the first three-dimensional structures of proteins. "For the first time the world knew what the outline of a protein looked like" (Klug, ref. below) John Kendrew and team determine the three-dimensional structure of myoglobin: Kendrew, J.; Dickerson, R.; Strandberg, B.; Hart, R. & Davies, D. "Structure of Myoglobin. A Three-Dimensional Fourier Synthesis at 2Å Resolution." <i>Nature</i> 185 (1960) 522-27.	Perutz, Science is not a quiet life, 169, 176	Perutz notebooks

	<p>Perutz and team determine the three-dimensional structure of hemoglobin: Perutz, Rossmann, M.; Cullis, A.; Murhead, H.; and Will, G. "Structure of Haemoglobin. A Three-dimensional Fourier Synthesis at 5.5Å Resolution, Obtained by X-ray Analysis" <i>Nature</i> 185 (1960) 416-22. The outline of the proteins did not reveal their inner workings. For hemoglobin there was no hint of the mechanism of respiratory transport.</p> <p>"Now, protein structures are solved at the rate of two or three a day, and the power of the method extends to cellular organelles and magadalton molecular structures. Perutz is commonly thought of as a crystallographer, but to him solving the molecular structure was the way to understand the mechanism behind the function. He was, above all, a chemist." Klug, "Max Perutz (1914-2002)", <i>Science</i> 295 (2002) 2382-83.</p>		
1960	Digital Equipment Corporation (DEC) introduces its first computer, the PDP-1, which is the first minicomputer. On advice from the venture-capital firm that financed the company, DEC does not call it a "computer" but a "programmed data processor" instead.		
1960	About six thousand computers are operational in the United States, and perhaps ten thousand worldwide.		
1960	J. Marmur and D. Lane Use of transformation to measure activity of melted and annealed DNAs	Brock ch. 9.13	
1960	T. Loeb Isolation of the first male-specific phage	Brock ch. 5.14	
1960	François Jacob, Jacques Monod, <i>et al</i> start to elucidate the way in which genes are controlled; they propose that DNA sequences outside the region that codes for protein respond to signals from "operator" genes that encode molecules that "switch" genes on or off. The development of the operon concept. Jacob, F. et al. 'l'Operon: groupe de genes à l'expression coordonné par un operateur. Comptes rendus (1960))245, 1727-29.	<p>Brock ch. 10.10; Genome Timeline.</p> <p>Yourgenome.org</p>	
1960	Arthur Kornberg synthesizes DNA in vitro, showing that an enzyme (DNA polymerase) will produce new strands using precursors, an energy source and a template DNA molecule		
1961	Regulatory mechanisms in bacteria: proposal for messenger RNA: François Jacob and Jacques Monod, "Genetic Regulatory Mechanisms in the Synthesis of Proteins," <i>J. Molec. Biol.</i> 3 (1961): 318-56. "The grand	Brock ch. 10.10; G-M 256.9	

	paper of Jacob and Monod that explained the basic process of regulating gene expression, at least in bacteria” (Brenner, <i>My Life</i> , 119).		
1961	Sydney Brenner, François Jacob, and Matthew Meselson show that short-lived RNA molecules, that they call messenger RNA (mRNA) carry the genetic instructions from DNA to structures in the cell called ribosomes. They demonstrate that ribosomes are the site of protein synthesis, “An Unstable Intermediate Carrying Information from Genes to Ribosomes for Protein Synthesis,” <i>Nature</i> 190 (1961): 576-80	Brock ch. 10.12; G-M 256.10	Hotchkiss’s copy of offprint
1961	Crick, Brenner and colleagues propose that DNA code is written in “words” called codons formed of three DNA bases. DNA sequence is built from four different bases, so a total of 64 (4 x 4 x 4) possible codons can be produced. They also propose that a particular set of RNA molecules subsequently called transfer RNAs (tRNAs) act to “decode” the DNA. Francis Crick, L. Barnett, Sydney. Brenner and R. J. Watts-Tobin, “General Nature of the Genetic Code for Proteins,” <i>Nature</i> 192 (1961): 1227-32. “There was an unfortunate thing at the Cold Spring Harbor Symposium that year. I said, ‘We call this messenger RNA’ Because Mercury was the messenger of the gods, you know. And Erwin Chargaff very quickly stood up in the audience and said he wished to point out that Mercury may have been the messenger of the gods, but he was also the god of thieves. Which said a lot for Chargaff at the time! But I don’t think that we stole anything from anybody—except from nature. I think it’s right to steal from nature, however.” (Brenner, <i>My Life</i> , 85).	G-M 256.8; Judson, pp. 467-68, 680	Offprint signed by Crick
1961	S. Brenner, F. Crick <i>et al.</i> , “The Theory of Mutagenesis,” <i>J. Molecular Biology</i> 3 (1961): 212-24	Judson, pp. 439, 678; Brenner, <i>My Life</i> , 94.	Offprint
1961	Use of artificial messenger RNA to deduce the genetic code: J.H. Matthaei and M.W. Nirenberg, “Characteristics and Stabilization of DNAase-Sensitive Protein Synthesis in <i>E. coli</i> Extracts,” <i>Proc. Nat. Acad. Sci.</i> 47 (1961): 1580-88 Nirenberg and Matthaei, “The Dependence of Cell-Free Protein Synthesis in <i>E. coli</i> upon Naturally Occurring or Synthetic Template RNA,” <i>Proc. Fifth International Congress of Biochem., Moscow, 10-16 August 1961, Vol. I: Biological Structure and Function on the Molecular Level</i> , ed. V. A. Engelhardt (N.Y.: Macmillan, 1963), pp. 184-89 (Judson states that in this paper M & N had “solved the coding problem”)	Brock ch. 10.12; G-M 256.11; Watson & Tooze timeline; Judson, pp. 453, 679	

1961	H.E. Umbarger Feedback control by end-product inhibition	Brock ch. 10.15	
1961	C. Yanofsky, D.R. Helinski, and B.D. Maling Isolation of CRM mutants	Brock ch. 10.14

1962	A. Campbell Hypothesis for integration of <i>lambda</i> into the bacterial chromosome	Brock ch. 7.6	
1962	Caspar and Klug propound principles of icosahedral virus structure. “The first paper would consider the geometrical aspects of virus design and assembly. . . [in it they] coin a number of new terms. Icosahedral virus shells can be classified according to their ‘triangulation number.’ Roughly, this number represents the number of triangles on any of the faces of the icosahedron. Because only certain triangulation numbers are possible, the Caspar-Klug theory predicts what may occur and what should not be seen in nature. They also introduced the term ‘self – assembly’ which described how the virus subunits, under the right conditions, assemble correctly into closed shells without any external aid. This new term was introduced with an extension to the crystal analogy.’ Self-assembly is a process akin to crystallization and is governed by the laws of statistical mechanics. The protein subunits and the nucleic acid chain spontaneously come together to form a simple virus particle because this is their lowest energy state.” (Morgan). Caspar, Donald L. D. and Klug, Aaron. “Physical Principles in the Construction of Regular Viruses”. <i>Cold Spring Harbor Symposia on Quantitative Biology</i> XXVII, 1-24	http://medicine.wustl.edu/~virology/gregmorgan.html	Manuscripts, correspondence relating to all aspects of this collaboration
1962	Aaron Klug moves to the MRC Laboratory of Molecular Biology at Cambridge		
1962 July 10	MRC Laboratory of Molecular Biology at Cambridge is dedicated (is this date correct??). “That’s the first sort of official sue of the term ‘molecular biology’. It comes from the ‘Molecular Structure of Biological Systems.’ And that’s about the time we founded the Journal of Molecular Biology.” (Brenner, My Life, 61)		Mimeographed press release and research summary (15pp) Klug’s copy
1962	Crick’s “The Recent Excitement in the Coding Problem” (<i>Progress in Nucleic Acid Research</i> 1 [New York: Academic Press, 1963], pp. 163-	Judson, pp. 469, 699	

	217) strongly criticizes “misdirection, sloppy work and hasty publication” in this field		
1962	Watson, Crick and Wilkins are awarded the Nobel Prize for Medicine / Physiology for their discovery of the structure of DNA; Perutz and Kendrew receive the Nobel Prize for Chemistry for their studies of the structures of myoglobin and hemoglobins.	Judson, p. 469	Perutz’s memorabilia of his receiving the Prize
1963	J. Cairns Autoradiographic evidence for the circular chromosome	Brock ch. 3.9	
1963	Allen M. Cormack shows that changes in tissue density can be computed from x-ray data. No machine is constructed at this time because of limitations in computing power. This is a key discovery leading in 1972 to the invention of computed tomography (CT).	Origins of Cyberspace	
1963	Allosteric interactions. Publication of “first great paper on allosteric proteins”: J. Monod, J.-P. Changeux, and F. Jacob, Allosteric proteins and cellular control systems, <i>J. Molecular Biology</i> 6 (1963): 306-9	Brock ch. 10.11 Judson pp. 552-53, 687	
1964 January	Brenner and colleagues publish the first paper on collinearity, i.e. that there is a simple congruence between the amino acid sequence of a protein and the nucleotide sequence of the gene determining that protein. Sarabhai, Stretton, Brenner & Bolle, Co-linearity of the gene with the polypeptide chain. <i>Nature</i> 201 (1964) 13-17.	Brock ch. 10.14	
1964	Charles Yanofsky and colleagues, establish that gene sequences and protein sequences are collinear. From this it follows that changes in DNA sequence can produce changes in protein sequence at corresponding positions: Yanofsky, C. et al, On the colinearity of gene structure and protein structure. <i>Proc. Nat. Acad. Sci. (USA)</i> 51 (1964) 266-74.	Brock ch. 10.14; Genome timeline. Yourgenome.org

1965	Publication of second paper on allosteric interactions: J. Monod, Jeffries Wyman, and J. P. Changeux, On the Nature of Allosteric Transitions: A Plausible Model, <i>J. Molecular Biology</i> 12 (1965): 88-118.	Judson, pp. 552, 687	
1965	Brenner and colleagues characterize the codons used as stop signals in DNA code. Termination codons (TAA, TAG, TGA) are not recognized by tRNA and act to terminate the growing protein chain. Brenner, S <i>et al.</i> "Genetic code: the 'nonsense' triplets for chain termination and their suppression". <i>Nature</i> 206 (1965) 994-98.	Genome Timeline, yourgenome.org	
1965	<p>David. C. Phillips and associates solve X-ray analysis of Lysozyme at 2Å resolution. This is the second atomic model for any protein and the first for an enzyme. Blake, C. C. F., Koenig, D. F., Mair, G. A., North, A. C. T., Phillips, D. C. & Sarma, V. R. (1965). <i>Nature (London)</i>, 206, 757. "Certain moments are deeply engraved in my memory. One is the Monday morning in March 1953 when Crick called me into his room to show me his and Jim Watson's double helical model of DNA which immediately revealed the molecular basis of heredity. Another is the moment when David Phillips, Louise Johnson and Charles Vernon made me first understand how an enzyme works." (Perutz) "At the time, transition-state chemistry was so new to me that I did not take in all the arguments, but the structure and mechanism that were now revealed made me ask why chemical reactions, which normally require powerful organic solvents or strong acids and bases, can be made to proceed in aqueous solution near neutral pH in the presence of enzyme catalysts. Organic solvents have the advantage over water of providing a medium of low dielectric constant, in which strong electrical interactions between the reactants can take place. The non-polar interior of enzymes seemed to me to provide the living cell with the equivalent of the organic solvents used by the chemists. The substrate is drawn into a medium of low dielectric constant in which strong electrical interactions between it and specific polar groups of the enzyme can occur.</p> <p>I felt tempted to add, 'Once we understand the stereochemical basis of</p>	<p>Timeline for British Crystallography; Perutz, Obituary of Phillips: http://www.iucr.org/iu-cr-top/people/philipd.htm or <i>J. Synchrotron Rad.</i> (1999). 6, 945-946.</p>	

	enzymic catalysis it may become possible to design and synthesize enzymes for specific catalytic functions, for both biological and industrial purposes. I look forward to a future Royal Society Discussion on that subject.””		
1965	Watson publishes <i>Molecular Biology of the Gene</i> (New York: W. A. Benjamin, 1965), the first textbook of molecular biology		book
1965	Monod, Lwoff and Jacob receive the Nobel Prize (Physiology / Medicine) for their discoveries concerning genetic control of enzyme and virus synthesis	Judson, p. 565	
1966	Watson through Harvard University Press circulates copies of the typescript of <i>Honest Jim</i> to about 10 people, including Perutz, Wilkins, Crick and a few others involved in the story. After much revision and a title change to “Base Pairs” the book will be published by Atheneum as <i>The Double Helix</i> in 1968.		Wilkins’ copy of the typescript signed and annotated; correspondence between Watson and Perutz and Wilkins pertaining to the book, etc.

1970	Hamilton O. Smith and Kent Wilcox isolate the first restriction enzyme-a protein that cuts DNA at specific sites defined by the base sequence. All of molecular biology uses restriction enzymes. Smith & Wilcox. "A restriction enzyme from <i>haemophilus influenzae</i> : I. Purification and general properties." <i>J. Mol. Biol.</i> 51 (1970) 379-91. Isolation of the first enzyme (the restriction enzyme) that cuts DNA molecules at specific sites	Watson & Tooze timeline; Genome Timeline, yourgenome.org. Brock ch. 11	

1970	<p>“The question, however, remained: How does the binding of oxygen to the iron atom of the heme group induce the subunits to change from the deoxy to the oxy structure: As Perutz put it, it is like the flea that makes the elephant jump. Perutz noticed the high-resolution electron density maps of the deoxystructure that the iron atom was displaced by a small but significant amount from the plane of the heme group, whereas in the oxy structure it lay almost in the plane. Armed with a knowledge of metal ion field theory, Perutz realized that this conformational change resulted from a change in the electron spin state of the iron atom, from high spin in the deoxy state to low spin in the oxy state, and hence to a reduction in the radius of the iron. Thus, in the oxy state the iron moves closer into the plane of the heme, and drags with it a protein α-helix to which it is connected. This is the trigger that sets in motion a set of ‘molecular levers’ that loosen and break the salt bridges, allowing the subunits in the ‘tense’ deoxy structure to rearrange themselves in the new ‘relaxed quaternary oxy structure.’” (Klug, Max Perutz (1914-2002) 2383. Perutz, “Stereochemistry of Cooperative Effects in Haemoglobin,” <i>Nature</i> 238 (1970) 726-39.</p>	Klug, Max Perutz (1914-2002) 2382-83; Perutz, <i>Science is not a Quiet Life</i> .	
1970	<p>Temin and Baltimore independently report the discovery of reverse transcriptase in RNA viruses. Reverse transcriptase is an enzyme that uses single-stranded RNA as a template for the production of a single-stranded DNA complement to that RNA. This discovery demonstrates the possibility of a flow of genetic information from RNA to DNA. Temin, Baltimore, and Dulbecco will receive awarded the Nobel Prize in Medicine and Physiology in 1975.</p>	Concise history at molecular-biologist.com

1974 March	Intel announces the 8080 eight-bit microprocessor. It powers the Altair 8800 designed by H. Edward Roberts, the first truly inexpensive personal computer. Within a year it will be designed into hundreds of different products.	Origins of Cyberspace	
1974	Brenner estimates the number of indispensable genes in the nematode, <i>C. elegans</i> . Brenner, S.” The Genetics of <i>Caenorhabditis elegans</i> ,” <i>Genetics</i> 77 (1974) 71-94. In 1989 John Sulston will map the genome of <i>C. elegans</i> . In 1998 its genome will be sequenced—the first of any multi-cellular organism.	Brenner, My Life, 144.	
1974	Call for a worldwide moratorium on certain classes of recombinant DNA experiments	Watson & Tooze timeline	
1974	The first of the three Cohen-Boyer recombinant DNA cloning patents is granted, leading to the foundation of the biotechnology industry. .	Hughes, “Making Dollars Out of DNA,” <i>Isis</i> 92(2001) 541-75.	
1975	Government report in the UK calls for special laboratory precautions for recombinant DNA research	Watson & Tooze timeline	
1975	“The genome of the MS2 virus of bacteria (made of RNA, not DNA) is the first genome to be sequenced.”	Genome Timeline yourgenome.org	
1975	The overwhelming number of genes in a human cell presents a major hurdle for researchers who wish to detect in a person's DNA a specific disease-fostering gene. Researchers had used the genetic code to determine the DNA sequence that codes for the series of amino acids that make up part of the hemoglobin protein. But they had no means of sifting the telltale DNA out of the DNA of the 100,000 other genes in a human cell, so that they could tell whether the gene was normal or not. Edward Southern develops a powerful method, later called Southern blotting, to pinpoint a specific genetic sequence. He describes a “new analytical tool involving the capillary transfer of restricted DNA fragments from a sizing gel to a nitrocellulose membrane, resulting in an exact replica of the DNA fragments in the gel on the membrane. A specific radio labeled	Molecular-biologist.com history	

	probe is then applied to the membrane under hybridizing conditions. Subsequent exposure of the membrane to photographic film reveals which DNA fragments are homologous to the specific probe used in the experiment. This technique allows researchers to determine a physical map of restriction sites within a gene in its normal chromosomal location and provides an estimate of the copy number of a gene in the genome along with information on the degree of similarity of the gene in question to other known homologous sequences. “ (m-b.com)		
1975	Paul. Berg <i>et al.</i> The Asilomar Conference (at Asilomar, California) on recombinant DNA urges adoption of guidelines regulating recombinant DNA experimentation, and calls for the development of safe bacteria and plasmids that cannot escape from the laboratory	Brock ch. 11 Watson & Tooze timeline	
1976	Release of first guidelines by the National Institutes of Health; prohibition of many categories of recombinant DNA experimentation. Rising public concern that the guidelines might not be effective. <i>New York Times Magazine</i> article urges prohibiting the awarding of the Nobel Prize for recombinant DNA research	Watson & Tooze timeline	
1976	First reported protein crystallography experiments at a synchrotron. At the Stanford synchrotron U.S.A. Phillips, J.C. Wlodawer, A. Yevitz, M.M & Hodgson, “.Applications of synchrotron radiation to protein crystallography: primary results,” <i>Proc. Nat. Acad. Sci. USA</i> 73 (1976) 128-132	http://www.dl.ac.uk/SRS/PX/history/history.html	
1976	Transfer RNA: F. H. C. Crick, S. Brenner, A. Klug and G. Pieczenik, “A Speculation on the Origin of Protein Biosynthesis,” <i>Origins of Life</i> 7 (1976).	Judson, pp. 337-38, 670	Large file over correspondence between involved scientists over controversy of this discovery made by Aaron Klug and Alexander Rich, who claimed to have made it.
1977	Walter Gilbert and Allan M. Maxam devise technique for sequencing DNA. “The Gilbert-Maxam method involved multiplying, dividing, and carefully fragmenting DNA. A stretch of DNA would be multiplied a millionfold in bacteria. Each strand was radioactively labeled at one end. Nested into four groups, chemical reagents were applied to selectively cleave the DNA strand along its bases—adenine (A), guanine (G), cytosine (C) and thymine (T). Carefully dosed, the reagents would break		

	the DNA into a large number of smaller fragments of varying length. In gel electrophoresis, as a function of DNA's negative charge, the strands would separate according to length—revealing, via the terminal points of breakage, the position of each base.” (http://gnn.tigr.org/timeline/timeline_frames.shtml)		
1977	Frederick Sanger and colleagues independently develop the methods for the rapid sequencing of long sections of DNA molecules. Sanger’s method, and that developed by Gilbert and Maxam make it possible to read the nucleotide sequence for entire genes that run from 1000 to 30,000 bases long. Sanger, F., Nicklen, S., and Coulson, A.R. DNA sequencing with chain-terminating inhibitors. <i>Proc. Nat. Acad. Sci. (USA)</i> 74 (1977) 5463-67. 1990	The first approved gene therapy is performed with some success. Immunoglobulin genes are inserted into harvested white blood cells that are then returned to the patient and confer some immunity.	Molecular-biologist.com history	
1990	David Lipman, Eugene Myers, and colleagues at the National Center for Biotechnology Information (NCBI) publish the BLAST algorithm for aligning sequences	http://ihome.cuhk.edu.hk/~z045513/	majorbreak/majorbreak.htm
1990	Project to sequence 3 MB of <i>C. elegans</i> genome coordinated between UK Medical Research Council Laboratory of Molecular Biology and Washington University, St. Louis. This is jointly funded by the MRC and NIH	Genome Timeline, yourgenome.org	
1990	Sydney Brenner proposes sequencing human cDNAs to provide rapid access to human genes.” One obvious way of finding at least a large part of the important [fraction] of the human genome is to look at the sequences of the messenger RNAs of expressed genes.” Brenner, S. The human genome: the nature of the enterprise. IN: <i>Human Genetic Information: Science, Law and Ethics</i> . Ciba Foundation Symposium 149 (1990) 6-12.	Genome Timeline, yourgenome.org	
1990 July	Sequence of human cytomegalovirus (HCMV) genome is completed. This is 0.23MB (229,354bp)		
1991	<p>J. Craig Venter (1946-) describes a fast new approach to gene discovery using Expressed Sequence Tags (ESTs). “Although controversial when first introduced, ESTs were soon widely employed both in public and private sector research. They proved economical and versatile, used not only for rapid identification of new genes, but also for analyzing gene expression, gene families, and possible disease-causing mutations.</p> <p>“ESTs could also facilitate an overview of the whole genetic repertoire of an organism, and in this way helped establish the important discipline of comparative genomics. EST databases were established for various animals, plants, and even fungi. In 1995, in a landmark supplement to <i>Nature</i>, the Venter team described some 170,00 ESTs that could be used</p>		

	to identify over 87,000 cDNA sequences from various tissues in the human body—over 80 percent of which were previously unknown.” (gnn.tigr.org/timeline) Adams, M.D., Kelley, J.M., Gocayne, J.D., Dubnick, M., Polymeropoulos, M.H., Xiao, H., Merril, C.R., Wu, A., Olde, B., Moreno, R., Kerlavage, A.R., McCombie, W.R., and Venter, J.C. Complementary DNA sequencing: "expressed sequence tags" and the human genome project. <i>Science</i> 252 , 1651-1656 (1991).		
1992	Venter leaves the National Institutes of Health and founds The Institute for Genome Research (TIGR).	Gnn.tigr.org/timeline/1995	
1992	John E. Sulston and Robert Waterston seek funding from the Wellcome Trust for 5-year proposal to sequence 40Mb of the human genome. The Wellcome Trust and the MRC join forces. The Wellcome Trust releases funds to support creating the Sanger Center near Cambridge.	Genome Timeline, yourgenome.org	
1992	The entire 315,000-base nucleotide sequence of one of the sixteen chromosomes of the yeast <i>S. cerevisiae</i> is published.	Molecular-biologist.com history	
1994	In meetings in the U. S. John Sulston and Robert Waterston propose to produce a “draft sequence of the human genome by 2000. This involves emphasizing sequence acquisition and the value of “draft quality sequence” to biomedical research. Marshall, E. A strategy for sequencing the genome 5 years early. <i>Science</i> 267 (1994) 783-4.	Yourgenome.org timeline	
1995	J. Craig Venter, Hamilton O. Smith, Fraser and colleagues at The Institute for Genomic Research (TIGR) report the first complete genome sequence of a free-living, nonviral microorganism, <i>Haemophilus influenzae</i> (H.flu). This genome consists of 1,830,137 base pairs. Fleischmann, R.D. <i>et al.</i> Whole-genome random sequencing and assembly of <i>Haemophilus influenzae</i> Rd. <i>Science</i> , 269 (1995) 496-512.	Yourgenome.org. timeline; Gnn.tigr.org/timeline/1995	
1995	The entire human genome is mapped, using yeast artificial chromosomes (YACs). Some chromosomes, notably 22, were mapped in fine detail. “The maps were an important step toward clone-based sequencing. Various authors. <i>Nature</i> 377 (1995) 175-379. The issue is devoted to the human genome maps.	Yourgenome.org. timeline	
1996	An international consortium completes the genome sequence of the yeast <i>Saccharomyces cerevisiae</i>	Yourgenome.org	
1997	The amount of human finished sequence reaches 40MB	Yourgenome.org	

February			
1997	The Roslin Institute in Edinburgh reports the birth of Dolly the lamb, the first mammal to be cloned from an adult using the modern techniques of transgenic cloning. The successful cloning of Dolly suggests the possibility that similar techniques could be utilized to clone humans.	Molecular-biologist.com	
1998 February	The amount of human finished sequence reaches 110MB.	Yourgenome.org timeline	
1998	Founding of public-private SNP Consortium to map Single Nucleotide Polymorphisms. These are “changes in single letters in our DNA code that can act as markers in the DNA landscape. Some SNPs are associated closely with susceptibility to genetic disease, our response to drugs or our ability to remove toxins.”	Yourgenome.org timeline	
1998 June	The complete genome sequence of the tuberculosis bacterium, <i>Mycobacterium tuberculosis</i> , is published by teams from England, France, U.S. and Denmark. Cole, S.T. et al., “Deciphering the biology of Mycobacterium tuberculosis from the complete genome sequence,” <i>Nature</i> 393 (1998) 537-44.	Yourgenome.org timeline	
1998 September	ABI Prism 3700 sequencing machine becomes available. This capillary-based machine is designed to run about 8 sets of 96 sequence reactions per day	Yourgenome.org timeline	
1998	Completion of the first genome of a multi-cellular organism— <i>C. elegans</i> . This organism is widely used in a range of biology. The <i>C. elegans</i> Sequencing Consortium. Genome sequence of the nematode <i>C. elegans</i> : A platform for investigating biology. <i>Science</i> 282 (1998) 2012-18.	Yourgenome.org timeline	
1999	Researchers in the Human Genome Project led by the Sanger Centre complete sequencing human chromosome 22. This is about 34 million base-pairs and includes at least 550 genes. Dunham, I. et al. The DNA sequence of human chromosome 22. <i>Nature</i> 402 (1999) 489-95.	Yourgenonme.org timeline	
1999 November	The data in the human draft sequence reaches 1000MB	Yourgenome.org timeline	
2000	Human Genome Project leaders at the Sanger Centre and the National Human Genome Research Institute announce the completion of a "working draft" DNA sequence of the entire human genome. At the same time Celera Genomics, founded by J. Craig Venter, announces	Yourgenome.org timeline	

	completion of their “first assembly” of the genome. Sanger Centre working draft site. NHGRI news pages.		
2000	Teams from the Sanger Centre, colleagues in the UK and Germany, and a group from the Institute for Genome Research (Craig Venter) publish sequences of different strains of <i>Neisseria meningitides</i> , the bacterium that causes many cases of meningitis. “The two strains have different properties and comparison of the two sequences was used to look for new vaccine targets.” Parkhill, J. <i>et al.</i> Complete DNA sequence of a serogroup A strain of <i>Neisseria meningitides</i> Z2491. <i>Nature</i> 404 (2000) 502-6.	Yourgenome.org timeline	
2000	In collaboration with the Pasteur Institute in Paris, teams from the Sanger Centre sequence the genome of <i>Mycobacterium leprae</i> , the causative agent of leprosy. “ <i>M. leprae</i> is extremely difficult to grow in the laboratory and genomic data is expected to speed study of this pathogen”. Sanger Centre. <i>M. leprae</i> site.	Yourgenome.org. timeline	
2000 March	J. Craig Venter’s Celera Genomics, in collaboration with the worldwide <i>Drosophila</i> community, and the federally funded Berkeley <i>Drosophila</i> Genome Project, sequence and assemble nearly 120MB of the <i>Drosophila</i> genome and release it to researchers at publication. “The genome sequence was determined by a whole genome shotgun sequencing strategy supported by clone-based sequencing and a BAC physical map.” Fruitfly -the Berkeley <i>Drosophila</i> Genome Project. Flybase -one mirror of a worldwide set of <i>Drosophila</i> databases. Eugene W. Myers, Granger G. Sutton, Art L. Delcher, Ian M. Dew, Dan P. Fasulo, Michael J. Flanigan, Saul A. Kravitz, Clark M. Mobarry, Knut H. J. Reinert, Karin A. Remington, Eric L. Anson, Randall A. Bolanos, Hui-Hsien Chou, Catherine M. Jordan, Aaron L. Halpern, Stefano Lonardi, Ellen M. Beasley, Rhonda C. Brandon, Lin Chen, Patrick J. Dunn, Zhongwu Lai, Yong Liang, Deborah R. Nusskern, Ming Zhan, Qing Zhang, Xiangqun Zheng, Gerald M. Rubin, Mark D. Adams, and J. Craig Venter A Whole-Genome Assembly of <i>Drosophila</i> . <i>Science</i> 287 , 2196-2204 (March 24, 2000).	Yourgenome.org timeline; gnn.tigr.org timeline/ 1999_Drosophila	
2001 February	“In a remarkable special issue, <i>Nature</i> includes a 60-page article by the Human Genome Project partners, studies of mapping and variation, as well as analysis of the sequence by experts in different areas of biology. <i>Science</i> publishes the article by Celera on the assembly of HGP and	Yourgenome.org timeline	

	<p>Celera data as well as analyses of the use of the sequence.” <i>Nature</i>, The Human Genome. Science, The Sequence of the Human Genome [Get specific references]</p> <p>“Celera Genomics announced the first complete assembly of the human genome. Using whole genome shotgun sequencing, Celera began sequencing in September 1999 and finished in December. Assembly of the 3.12 billion base pairs of DNA, over the next six months, required some 500 million trillion sequence comparisons, and represented the most extensive computation ever undertaken in biology.</p> <p>“The Human Genome Project reported it had finished a "working draft" of the genome, stating that the project had fully sequenced 85 percent of the genome. Five major institutions in the United States and Great Britain performed the bulk of sequencing, together with contributions from institutes in China, France, and Germany.” (gnn.tigr.or/timeline/2000)</p>		
2002 February 6	Max Perutz dies.
